34. Includes \$1,200 initiation of plans for specifications for Code 710 recreation facilities, for FY 1978. Construction of recreation facilities at Martis Creek Lake under Code 720 was determined to be infeasible.

35. Includes contributed funds, other \$4,572,938, for lands, easements and rights-of-way for Castle Dam from State of California and contributed funds, other costs for lands, easements and rights-of-way for Castle Dam.

36. Includes \$274,000 contributed funds, other, relocation and \$227,968 costs.

37. In addition, \$66,532 expended for new work from contributed funds, other, miscellaneous construction under local cooperation requirements as related to acquisition of right-of-way and utility alterations for Merced County Stream Group.

38. Includes \$1,949,968 San Francisco construction funds and costs and \$260,000 Sacramento general investigation funds and costs for Pajaro River.

39. Includes \$37,250 contributed funds, other, from Santa Clara Valley Water District for bridge relocation at Pajaro River.

40. Includes \$37,250 contributed funds, other, costs for bridge relocation at Pajaro River.

41. Includes code 710 funds and costs for recreation facilities at Pine Flat Lake: Total to date: \$1,595,100. Includes Public Work Acceleration, Executive (PL 87-68) (Transfer to Corps of Engineers, Civil) 1963 funds and costs (\$239,235) for recreation facilities and \$19,600 Code 713 funds and costs for Pine Flat fish barrier.

42. Includes \$158,300 special recreation fees and costs at Pine Flat Lake and \$799,785 maintenance and operation of dam funds and costs at Pine Flat Dam.

43. Previously reported as Regional Conjunctive Use, CA

44. Includes \$701,546 contributed funds, other costs for road relocation (Nees Avenue) and betterments at Fancher Dam.

TABLE 35-A (Cont'd) COST AND FINANCIAL STATEMENT

45. Excludes \$5,598,000 contributed funds: \$400,000 for recreation facilities at completed projects funded under Public Works Acceleration Program; and \$1,628,411 for recreation facilities at completed projects funded under Code 711 at Coyote Valley Dam, Lake Mendocino.

46. Includes \$94,459 special recreation use fees and costs (FY 1982-1983), but excludes prior special recreation fees and cost for Coyote Valley Dam, Lake Mendocino.

47. Includes \$1,625,280 maintenance and operation of dam funds and costs at Coyote Valley Dam, Lake Mendocino for FY 1985 through FY 1996.

48. Includes \$251,911 contributed funds, other from City of Ukiah for Coyote Valley Dam, Lake Mendocino, hydropower studies; and \$338,000 from California department of Boating and Waterways for launching facility at Lake Mendocino.

49. Includes \$250,117 contributed funds, other, costs for Coyote Valley Dam, Lake Mendocino, hydropower studies; and \$331,657 for California Department of Boating and Waterways for launching facility at Lake Mendocino.

50. Includes \$253,421,793 San Francisco construction funds and costs through August 1983 for Dry Creek, Warm Springs Dam.

51. Includes \$964,114 San Francisco maintenance funds and costs through April 1982 for Dry Creek, Warm Springs Dam.

52. Includes \$75,400 maintenance and operations of dam funds and costs at Dry Creek, Warm Springs Dam.

53. Includes \$208,074 contributed funds, other, from Sonoma county for Dry Creek, Warm Springs, hydropower studies; and \$22,500 from City of Ukiah for hatchery pump design at Lake Mendocino.

54. Includes \$208,074 contributed funds, other, costs for Dry Creek, Warm Springs hydropower studies; and \$20,658 costs for hatchery pump design.

55. Excludes \$614,608 for Table Mountain (Iron Canyon) project, deauthorized August 5, 1977, and \$531,000 for Sacramento River and Major and Minor Tributaries portions which are considered inactive and deferred.

56. Includes Code 710 funds and cost for recreation facilities at Black Butte lake: Total to date \$1,000,162.

57. Includes \$104,100 special recreation use fees and costs at Black Butte Lake.

58. Miscellaneous construction and engineering and design services (non-project) accomplished at

expense of State of California under local cooperation requirements in connection with acquisition of rights-of-way and utility alterations (primarily for Sacramento River and Major and Minor Tributaries project). Includes State Highway Commission payment, \$789,008, for use of excess excavation from Chico and Mud Creeks and Sandy Gulch (Sacramento River and Major and Minor Tributaries) for freeway embankment through the city of Chico.

59. Includes \$41,984 contributed funds, other, from State of California for required modification of existing private facilities and salmon rearing habitat, Sacramento River, Chico Landing to Red Bluff; \$15,977 contributed funds, other, from State of California Department of Boating and Waterways for replacing a boarding float at Orland Buttes boat launching ramp at Black Butte Lake; \$392,000 contributed funds, other, from the City of Santa Clara for hydropower studies at Black Butte Lake; and \$59,334 contributed funds, other from State of California for relocation. Includes \$389,335 contributed funds, other, costs for Black Butte hydropower studies; and \$59,334 costs for relocations

60. Includes FY06 supplemental funding \$7,100,000.

61. Includes GRR funding.

62. Includes \$8,849,825 San Francisco construction funds for Walnut Creek.

63. Includes \$9,049,609 San Francisco construction costs for Walnut Creek.

64. Includes \$450,268 San Francisco required funds for Walnut Creek.

65. Includes \$525,846 San Francisco required costs for Walnut Creek.

66. Includes \$400,348 San Francisco contributed funds, other, and contributed funds costs for Walnut Creek.

67. Includes \$1,110,000 allocated to SF District pre 1983.

68. Includes \$1,937,000 contributed funds, other, from Contra Costa Flood Control and Water Conservation District for replacement of sewer line in Richmond for Wildcat and San Pablo Creeks project.

69. Includes \$1,906,943 contributed funds, other, costs for replacement of sewer line in Richmond for Wildcat and San Pablo Creeks project.

70. Excludes funds applicable to other units of this basin authorization (Lower San Joaquin River and Tributaries, and Tuolumne River Basin, California). (See Table 35-E). Includes \$110,000 utilized for

TABLE 35-A (Cont'd) COST AND FINANCIAL STATEMENT

preparation of 1957 Economic Feasibility Report and of Revised Feasibility Report (FY 1960, 1961, and 1962) applicable to 1962 reauthorization of prefect.

71. Includes \$110,000 utilized for preparation of 1957 Economic Feasibility Report and of Revised Feasibility Report (FY 1960, 1961, and 1962) applicable to 1962 reauthorization of project.

72. Includes \$80,000 contributed funds, other, and costs, from the Bureau of Reclamation for visitors

center at Mark Twain area, New Melones Lake. 73. \$884.43 in Non-federal funds were for other than required contribution in FY07. Additionally, \$2,933.31 of Non-federal funds were for other than required contribution in FY06.

74. Includes \$1,900,000 for FY06 Required Contributed Funds.

SACRAMENTO, CA DISTRICT

1. Beginning in FY 1982, Advance Engineering and Design (Preconstruction, Engineering and Design) programs are funded under General Investigations Appropriations.

2. Includes FY 1985 unobligated carryover and FY 1986 allocation for CP&E funds and all AE&D funds to be included in project cost (for cost sharing) per TWX of September 9, 1985.

3. Excludes \$2,639,955 funds and costs for a previous flood control project on Napa River. (See Table 35-E).

TABLE 35-B

AUTHORIZING LEGISLATION

See Section In Text	Date Authorizing Act	Project and Work Authorized	Documents
1.		SACRAMENTO RIVER, CA	
	Mar 3, 1899	A depth of 7 feet below Sacramento works	H. Doc. 186, 55th Cong., 2d sess., and 48 55th Cong., 3d sess. (Annual Report 1898, p. 2844 and 1899, p. 3171).
	July 25, 1912	For work above Sacramento.	H. Doc. 76, 62d Cong., 1st sess. 1
	Jan 21, 1927	The 10-foot channel up to Sacramento	H. Doc. 123, 69th Cong., 1st sess. Rivers and Harbors Committee Doc. 35, 73d Cong., 2d sess.
	Aug 30, 1935	A depth of 6 feet between Sacramento and Colusa and 5 feet between Colusa and Chico Landing at a cost of \$390,000 provided flow of rivers is increased to minimum flow of 5,000 cubic feet per second after Shasta Reservoir is built.	Rivers and Harbors Committee Doc. 35, 73d Cong., 2d sess.
	Aug 30, 1935	Authority for a special direct participation of Federal Government of \$12 million in cost of Shasta Reservoir.	5. Doc. 142, 79th Cong., 2d sess.
	Aug 26, 1937	Transfer of authority for expenditure of above \$12 million from Secretary of War to Secretary of the Interior.	
	July 24, 1946	Modified existing navigation project for Sacramento River, CA, to provide for construction of a ship channel 30 feet deep and 200 to 300 feet wide from deep water in Suisun Bay to Washington Lake, including such works as may be necessary to compensate for or alleviate any detrimental salinity conditions resulting from ship channel; a triangular basin of equal depth, 2,400 by 2,000 by 3,400 feet at Washington Lake; and connecting channel 13 feet deep and 120 feet wide, with lock and drawbridge, thence to Sacramento River.	Sec 1002, 1986 WRDA
	Nov 17, 1987	Deauthorization of shallow-draft channel, Colusa to Red Bluff, feature of project for navigation, Sacramento River, California.	

TABLE 35-B (Cont'd) AUTHORIZING LEGISLATION

See Section In Text	Date Authorizing Act	Project and Work Authorized	Documents
	Dec 11, 2000	Reauthorization of Sacramento River, Major and Minor Tributaries and Chico Landing to Red Bluff, CA	Sec 350 (a) (1-2), WRDA 2000
13.		CORTE MADERA CREEK, CA	
	Oct 23, 1962	Levees and channel improvements, lower 11 miles of Corte Madera Creek and tributaries, as modified by Chief of Engineers.	H. Doc. 545, 87th Cong., 2d sess.
	Nov 7, 1966	Local cooperation requirements modified to provide 1.5 percent cash contribution toward cost of Ross Valley unit.	Sec. 204, 1966 Flood Control Act.
	Nov 17, 1986	Modify existing project to direct construction of Unit 4 from Lagunitas Road Bridge to Sir Francis Drake Boulevard, and to include construction of flood-proofing measures in vicinity of Lagunitas Road Bridge to insure proper functioning of completed portions of authorized project. Further modify project to eliminate any channel modifications upstream of Sir Francis Drake Boulevard.	Sec 823, 1986 WRDA
29.		RUSSIAN RIVER BASIN, CA	
	May 17, 1950	Coyote Valley Dam (Lake Mendocino): Channel improvements on lower 98 miles of Russian River and lower reaches of tributaries.	H. Doc. 585, 81 st Cong., 2d sess.
	Feb 10, 1956	Increased appropriation authorization for initial stage of project development.	PL 404, 84 th Cong., 2d sess.
	Oct 23, 1962	Dry Creek (Warm Springs) Lake: Channel Improvements on Dry Creek below dam.	H. Doc. 547, 87 th Cong., 2d sess.
	Mar 7, 1974	Dry Creek (Warm Springs) Lake and channel; compensate for fish losses on the Russian River which may be attributed to the operation of the Coyote Dam component of the project through measures such as possible expansion of the capacity of the fish hatchery at the Warm Springs Dam component of the project.	Sec. 95, 1974 WRDA
30.		SACRAMENTO RIVER AND TRIBUTARIES, CA, FROM COLLINSVILLE TO SHASTA DAM	

TABLE 35-B (Cont'd)

AUTHORIZING LEGISLATION

See Section In Text	Date Authorizing Act	Project and Work Authorized	Documents
	Dec 22, 1944	Modify Sacramento River Flood Control Project to provide for extensions in levees and other structures along Sacramento River and major and minor tributaries; construct Black Butte Dam and Reservoir; construct low-level Table Mountain Dam and Reservoir with power facilities; and provision of monetary authorization of \$15 million for initiation of modification.	H. Doc. 649, 78 th Cong., 2d sess. ²
	May 17, 1950	Improvements for protection of Upper Butte Basin (included full monetary authorization).	H. Doc. 3667, 81st cong., 1st sess. ²
	Jul 3, 1958	Extend existing Sacramento River Flood Control Project to Keswick Dam for purposes of zoning area below dam and modification of project by construction of bank protection and incidental channel improvements between Chico Landing and Red Bluff (included full monetary authorization).	H. Doc. 272, 84th Cong., 2d sess. ²
	Jul 3, 1958	Additional authorization of \$17 million for comprehensive plan approved in act of December 22, 1944.	
	Jul 14, 1960	Further modification of Sacramento River Flood Control Project by construction of initial 10- year phase of bank erosion control works and setback levees on Sacramento River and authorization of \$14,240,000 for prosecution of modification.	S. Doc. 103, 80th Cong.,
	May 12, 1967	Additional authorization of \$7 million for bank approved in act of July 14, 1960.	PL 90-17
	Mar 7, 1974	Initiation of construction of second phase of bank control works and setback levees on Sacramento River as approved in act of July 14, 1960, and additional authorization of \$16 million for such purpose. ³	PL 93-251
	Jun 19, 1975	Deauthorization of Table Mountain Dam and Reservoir. ⁴	H. Doc. 94-192, 94th Cong., 1st sess

TABLE 35-C OTHER AUTHORIZED NAVIGATION PROJECTS

Project	Status	For Last	Cost to Sep. 30, 2007	
		Full Report See Annual Report For	Construction	Operation and Maintenance
Feather River, CA	Completed	1951	\$ 8,354 ₃	\$ 5,752 ^{1 2}
Middle River and Connecting Channels, CA		1974	8,500	93,494

Navajo Reservoir, NM	Completed	-	23,185 ₇	-
Old River, CA	Completed	1970	-	-
Stockton and Mormon Channels, CA	Completed	1970	253,151 ₈	9,631,128
Suisun Bay Channel, CA	Completed	1974	200,928 _{9 10 11}	218,854
Suisun Channel, CA	Completed	1973	217,677	3,316,622 ^{12 13}
Suisun Point Channel, CA	Completed	1965	191,728 _{5 15}	733,489

1. Maintenance project, channels adequate for commerce.
2. Includes \$10 for maintenance for previous project. Excludes \$6,160 for previous project and \$3,840 for existing project for maintenance expended from contributed funds.
3. Includes \$1,600 for previous project.
4. Includes \$790 for previous project.
5. Authorized by Chief of Engineers under authority of sec. 107, Public Law 86-64.5, as amended.
6. All costs transferred from Los Angeles District in FY 1968.
7. Estimated cost to local interests was \$3,6000 for lands, damages and public landings. Remaining portion of project, consisting of side channel at Orwood and completion of project channels from mouth of Old River to Lammers Ferry road and from Crocker Cut to Holly Sugar Factory was deauthorized November 17, 1986, by WRDA of 1986.
8. Upon completion of Mormon Slough, Calaveras River, CA in February 1970, local interests accepted

- maintenance responsibility for Mormon Slough as well as for Stockton and Mormon Channels CA, and Federal maintenance was discontinued. No Federal maintenance costs have been incurred since FY 1969.
9. Includes \$58, 901 for previous project.
10. Excludes \$59,551 expended from required contributed funds for previous project.
11. Excludes work accomplished under existing project at a cost of \$207,198 from Public Works Administration funds allotted to San Joaquin River, CA.
12. Includes \$59,817 for previous projects. Excludes \$5,449 expended from required contributed funds for previous project.
13. Maintenance responsibility transferred to San Francisco District, January 1, 1974.
14. Includes reconnaissance and condition surveys of \$5,496 and \$483 for fiscal year 1963 and 1964, respectively.
15. Estimated cost (July 1964) to local interests was \$12,000 for lands, damages, and spoil retention dikes.

TABLE 35-E (Cont'd) OTHER AUTHORIZED FLOOD CONTROL PROJECTS

1. Project responsibility transferred from San Francisco District to Sacramento District April 1, 1982.
2. Scheduling of reservoir operations costs.
3. Excludes \$54,919 other contributed funds for miscellaneous construction for local interests pursuant to requirements of local cooperation were \$951,000 (1959) for lands and relocations.
4. Excludes \$44,008 other contributed funds for construction in connection with bridge construction pursuant to requirements of local cooperation. Total cost to local interests for all requirements of local cooperation was \$370,000 (9159) for lands and relocations.
5. Authorized by Chief of Engineers under authority of sec. 205, Public Law 80-858, as amended.
6. Excludes \$22,000 for preauthorization studies.
7. Project not economically feasible; preconstruction planning was terminated in FY 1993.
8. Excludes \$69,262 other contributed funds from State of California for two low water crossings and appurtenances at Chester. A fish ladder modification project was continued under sec. 1135 in FY 2001 at fiscal year cost of \$38,765.
9. Excludes \$50,000 for preauthorization studies. Estimated costs to local interests were \$665,000 for lands and damages including relocations.
10. Includes \$174,938 Public Works Acceleration Program Funds.
11. Transferred to Bureau of Reclamation in May 1956 for operation and maintenance by that agency in conjunction with other units of Central Valley project.
12. Excludes \$20,000 for preauthorization studies.
13. Includes \$30,000 for preauthorization studies. Estimated costs (FY 1973) to local interest for all requirements of local cooperation were \$150,117 for lands and damages including relocation.
14. Includes \$73,000 for preauthorization studies. Non-Federal (Kern County Water Agency) cost for road relocation was \$18,260 (required contributed funds).
15. Constructed by East Bay Municipal Utility District. Final Federal contribution of \$51,202 made July 18, 1978 (total \$10,111,684). Non-Federal costs \$34,988,53616.
16. Constructed by State of California. Final Federal contribution of \$64,186 was made on February 9, 1981 (total \$69,994,105) for flood control reservation.
17. Cherry Valley and New don Pedro Reservoirs constructed by local interests. Federal contribution of \$9,000,000 and \$5,464,000, respectively, for flood control reservation. Final
18. Federal contribution of \$308,898 was made on January 18, 1972, for New don Pedro. Excludes \$3,004,946, contributed funds, other, for miscellaneous engineering and construction (non-project) at local interest expense under local
19. cooperation requirements for acquisition of rights-of-way for levee and channel improvement on Lower San Joaquin River and Tributaries. Unconstructed portion of snagging and clearing project modification of Lower San Joaquin River and Tributaries) was classified as "deferred" on April 9, 1993. For full report see Annual Report for FY 1993.
20. Planning and any future development is uncertain awaiting State of California's position on support of Marysville project.
21. Constructed by Merced Irrigation District, Final Federal contribution of \$839 was made December 2, 1975 (total \$10,818,638) for flood control reservation.
22. Estimated costs (FY 1967) to local interests for all requirements of local cooperation were \$1,340,000 for lands and damages including relocation.
23. Non-Federal cost \$2,965,402 (FY1976) for lands and relocations. Federal contribution of \$599,336 made to State Reclamation Board.
24. This project was reclassified as "active" on August 3, 1987.
25. Constructed by Yuba County Water Agency. Final Federal contribution of \$33,470 was made in FY 1972 (total \$12,759,127) for flood control reservation.
26. Includes \$41,800 for preauthorization studies.
27. Excludes \$146,000 other contributed funds for miscellaneous construction and engineering and design services under local cooperation requirements in connection with acquisition of rights-of-way, relocation and utility alterations.
28. Includes \$107,000 costs for remedial work to drainage system completed in FY 1977.
29. Includes \$52,549 contributed funds.
29. Cost includes engineering and design prior to June 30, 1952 and costs of \$4,288 (FY 1962-1963) to determine if project classification to an active category was justified.
30. Estimated cost to local interest for all requirements of local cooperation were \$463,000 (July 1962) for lands and damages including relocations. Project prevented \$4,544,000 in damages from the April-May 1994 snowmelt runoff.
31. Excludes \$285,329 contributed funds.
32. Excludes \$200,000 estimated value of work performed in lieu of cash contribution.
33. Excludes \$421,182 contributed funds.
34. Excludes \$48,000 required contributed funds toward first cost. Costs to local interests for all requirements of local cooperation, including required contributions, were \$118,000 (1951). Project prevented \$9,000 in damages from the April-May 1994 snowmelt runoff.
35. Place inactive 1974.

TABLE 35-G DEAUTHORIZED PROJECTS

Project	For Last Full Report See Annual Report For	Date Deauthorized	Federal Funds Expended	Contributed Funds Expended
Alhambra Creek, CA	1981	1986	\$300,000	-
Bear River, CA	1980	1986		-
Cottonwood Creek	1991	1998	15,765,000	- 2/
Eel River, CA	971	1986	1,272,816	-
Gleason Creek, NV	1977	1986	215,826	-
Humboldt River and And Tributaries, NV	1982	1986	1,532,932	-
Lakeport Lake, CA ~	1976	1993	2,353,000	-
Little Valley Wash, Magna, UT	1951	1977		-
Lower San Joaquin River And Tributaries, CA	1993	1998	27,835,263	- 2/
Mad River Basin, CA	1973	1986	4,243,750	-
Spanish Fork River, UT	1955	1977	20,000	-
Weber River and Tributaries, UT (Morgan County)	1974	1972	75,120	-
Wildcat and San Pablo Creek Reach 2, CA	1997	1998		-

1. Lakeport Lake was deauthorized on November 17, 1988; and deauthorized November 18, 1993.
2. Requested reauthorization March 2001.

TABLE 35-H SACRAMENTO RIVER, CA: TIDAL AND FLOOD CONDITIONS PREVAILING (See Section 1 of Text)

Place	Miles from Mouth of River	Range in Feet			
		Mean Tidal ¹	Extreme Tidal ²	Ordinary Flood ³	Extreme Flood ⁴
Collinsville	0	4.3	7	8	10
Sacramento	59	2.0 ²	3	20	28
Verona (Mouth of Feather River)	80	-	Trace	22	30
Colusa	144	-	-	26	32
Chico Landing	193	-	-	20	25
Red Bluff	248	-	-	24	30

1. Mean lower low water to mean higher high water.
2. Tide at low water season only.
3. Mean lower low water to flood stage.
4. Extreme low water to indicated flood condition.

TABLE 35-I **SAN JOAQUIN RIVER, CA:**
TOTAL COST OF NEW WORK FOR PROJECT 1
(See Section 4 of Text)

Modification	Federal			Non-Federal ²		Total Project
	Corps of Engineers (Construction)	Coast Guard (Construction)	Required Cash Contribution	Lands and Damages (including Relocations)	Total	
Prior to 1950 Modification	\$4,009,938	\$80,000	\$1,307,500	\$1,042,000	\$2,349,500	\$6,439,438
1950 Modification	1,823,179		35,000	135,000	170,000	1,993,170
Total	5,833,117	80,000	1,342,500	1,177,000	2,519,500	8,432,617

1. Completed in May 1960.

2. Excludes \$5,865,000 (Feb 1954) local interests costs for Stockton Deep Water Channel terminal facilities required under terms of project authorization.

TABLE 35-J **SAN JOAQUIN RIVER, CA:**
PROJECT UNITS (1950 MODIFICATION) RECLASSIFIED AND EXCLUDED FROM PROJECT COST,
(See Section 4 of Text)

Unit	Federal Corps of Engineers	Required Cash Contributions	Non-Federal		Total Project
			Lands and Damages (including Relocations)	Total	
Settling Basin above head of Burns Cutoff ¹	\$1,073,000	\$30,000	\$200,000	\$230,000	\$1,303,000
Burns Cutoff improvement; new turning basin; dredging Mormon Channel ^{2,5}	7,882,000 ³	431,000	1,455,000	1,886,000	9,768,000
Upper Stockton Channel enlargement ^{4,5}	535,000	34,000	15,000	49,000	584,000

1. July 1959 price index. Deauthorized August 5, 1977.

2. Deferred; July 1960 price index.

3. For lands and construction

4. Deleted by 1965 River and Harbor Act authorization of San Francisco Bay to Stockton Channel, Sacramento District, Improvement No. 3.

5. Deauthorized November 17, 1986.

|--|---|

SAN FRANCISCO, CA, DISTRICT

29. Excludes \$115,536 contributed funds. Includes \$601,394 for reconnaissance and condition surveys, FY 1956-2007.
30. Includes \$1,030,399 for previous projects. Excludes \$134,591 contributed funds for existing project. Includes \$193,000 Public Works Administration funds.
31. Includes \$475,321 for previous projects and \$813,611 for reconnaissance and condition surveys, FY 1956-2007.
32. Authorized by FC Act of 1965 (Sec. 201); Maintenance R&H Act of 1970 (Sec. 103). Includes \$446,473 for reconnaissance and condition surveys FY 1979-2007. See FY 1977 Annual Report for last full report. Excludes contributed funds of \$885,712.
33. Includes \$1,086,703 for previous projects.
34. Includes \$1,359,380 for previous projects and \$545,164 for reconnaissance and condition surveys, FY 1956-2007.
35. Excludes \$810,046 contributed funds on previous project.
36. See Sacramento District FY 1974 Annual Report for detail.
37. Project maintenance responsibility to Point Edith was transferred to San Francisco District January 1, 1974. Excludes Sacramento District's portion. Includes \$271,945 for reconnaissance and project condition surveys, FY 1976-2007.
38. Project maintenance assigned to San Francisco District from Sacramento District January 1, 1974. See Sacramento District 1972 Annual Report for full report.
39. Includes \$755,318 for reconnaissance and condition surveys, FY 1978-2007. Includes \$727,510 for previous project. Excludes \$121,386 contributed funds.
40. See FY 1981 Annual Report for last full report.
41. Excludes Contributed Funds of \$709,624.
42. See Sacramento District FY 1985 Annual Report for full report. Includes \$39,170,200 under San Francisco District's Construction, General. Excludes Sacramento District's funding of \$27,766,800.
43. Excludes \$100,000 contributed funds and \$105,000 contributed in lieu of royalty-free rock.
44. See FY 1979 Annual Report for last full report.
45. Includes \$494,778 for reconnaissance and condition surveys, FY 1970-2007.
46. Includes \$806,757 for reconnaissance and condition surveys, FY 1970-2007. Excludes \$93,500 contributed funds.
47. Excludes \$41,094 contributed funds.
48. Includes \$9,199,000 funds of which \$8,499,000 was under Construction, General and \$700,000 under General Investigations.
49. Includes \$9,199,000 costs of which \$8,499,000 was under Construction, General and \$700,000 under General Investigations.
50. See FY 1987 Annual Report for last full report.
51. Includes \$165,806 for reconnaissance and condition surveys, FY 1989-2007.
52. See FY 1988 Annual Report for last full report.
53. Includes \$311,505 for reconnaissance and condition surveys, FY 1993-2007.
54. Excludes \$5,598,000 contributed funds: \$400,000 for recreation facilities at completed projects funded under Public Works Acceleration Program; and \$1,628,411 for recreation facilities at completed projects funded under Code 711 at Coyote Valley Dam, Lake Mendocino.
55. Includes \$94,459 special recreation use fees and costs (FY 1982-1983), but excludes prior special recreation fees and cost for Coyote Valley Dam, Lake Mendocino.
56. Includes \$251,911 contributed funds, other from City of Ukiah for Coyote Valley Dam, Lake Mendocino, hydropower studies; and \$338,000 from California Department of Boating and Waterways for launching facility at Lake Mendocino.
57. Includes \$250,117 contributed funds, other costs for Coyote Valley Dam, Lake Mendocino, hydropower studies; and \$320,657 for California Department of Boating and Waterways for launching facility at Lake Mendocino.
58. Includes \$253,421,793 previous San Francisco construction funds and costs through August 1983 for Dry Creek, Warm Springs Dam.
59. Includes \$964,114 previous San Francisco maintenance funds and costs through April 1982 for Dry Creek, Warm Springs Dam.
60. Includes \$208,074 contributed funds, other, from Sonoma County for Dry Creek, Warm Springs, hydropower studies; and \$22,500 from City of Ukiah for hatchery pump design at Lake Mendocino.
61. Includes \$208,074 contributed funds, other, costs for Dry Creek, Warm Springs hydropower studies; and \$20,658 costs for hatchery pump design.
62. Includes \$7,303,725 San Francisco District construction funds and costs for Corte Madera Creek.
63. \$8,695 contributed funds transferred to Sacramento District in FY 1983. Includes \$97,400 San Francisco District required contributed funds and costs.
64. Contributed funds, other, and costs, from Marin County including \$536,921 for miscellaneous bridge and road relocations and \$267,840 for additional expenses for disposal sites at Corte Madera Creek.
65. See FY 1998 Annual Report for last full report.
66. Includes \$212,083 for previous project and \$4,929,823 under Section 205 and \$17,199,024 under Construction, General.
67. Includes unobligated carryover for continuation of planning and engineering (CP&E) funds as of September 30, 1985 (\$33,474) for Sacramento River Deep Water Ship Channel to be included in project cost (for cost sharing) per TWX of September 9, 1985. Includes Sacramento District's FY 02 approp of \$2,000 and San Francisco District's FY 02 approp of 117,000.
68. Includes Sacramento District's FY 02 cost of \$27,983 and San Francisco District's FY 02 cost of 99,152.

TABLE 34-B **AUTHORIZING LEGISLATION**

See Section in Text	Date of Authorizing Act	Project and Work Authorized	Documents
1.	CRESCENT CITY HARBOR, CA		
	Jul. 18, 1918	A breakwater bearing S. 26-1/4 E. from Battery Point to Fauntleroy Rock and breakwater from the shore to Whaler Island.	H. Doc. 434, 64th Cong., 1st sess.
	Sep. 22, 1922	Modified condition of local cooperation which required that local interests construct a railroad from Grants Pass, Oregon to Crescent City so that a State Highway to Grants Pass would be an acceptable alternate.	Rivers & Harbors Committee Doc. 4, 67th Congress, 2nd sess.
	Jan. 21, 1927	Extension of the breakwater to a length of 3,000 feet and a reduced cash contribution required of local interests.	H. Doc. 595, 69th Cong., 2nd sess.
	Aug. 30, 1935	Maintaining by dredging of an outer harbor basin, 1,800 feet long, 1,400 feet wide and 20 feet deep, except in rock.	Rivers & Harbors Committee Doc. 40, 74th Cong.
	Aug. 26, 1937	Construction of a sand barrier from Whaler Island to the mainland and for maintenance dredging in the vicinity of the seaward end of the sand barrier.	Senate Committee Print, 75th Cong., 1st sess.
	Mar. 2, 1945	Extension of existing breakwater 2,700 feet to Round Rock (modified by Chief of Engineers, 1952).	H. Doc. 688, 76th Cong., 3rd sess.
	Mar. 2, 1945	Construction of inner breakwater and removal of pinnacle rock and other material from the harbor to a depth of 12 feet and a harbor basin with a project depth of 10 feet.	Report on file in office, Chief of Engineers.
	Oct. 27, 1965	Extension of inner breakwater and dredging of T-shaped harbor basin to depth of 20 feet.	H. Doc. 264, 89th Cong., 1st sess.
2.	HUMBOLDT HARBOR, CA		
	Mar. 3, 1881	Channel 10 feet deep by 350 feet wide to be dredged along Eureka waterfront, thence 8 feet deep by 200 feet wide west to natural channel; dredging Mad River Shoal to 8 feet deep.	H. Doc. 59 Cong., 3rd sess.
	Jul. 5, 1884	Construct South Jetty and continue channel improvements.	River & Harbor Approp Act of 1884
	Aug. 5, 1886	\$75,000 continued improvement of Harbor with provision for title to 12 acres of land to be conveyed to the U.S.	River & Harbor Approp Act of 1886
	Jul. 3, 1892	Map and cost estimates for continuing Harbor improvements with provision for two parallel jetties.	Chief of Engrs Annual Report (p.3120) Annual River & Harbor, Approp Acts 1892-1899
	Mar. 3, 1899	Continuing Harbor improvements with provision for two parallel jetties.	H. Doc. 528, 55th Cong., 2nd sess.
	Jun. 25, 1910	Rebuilding the jetties and channel improvements to Arcata and Hookton.	H. Doc. 950, 60th Cong., 1st sess.,
			H. Doc. 204, 61st, Cong., 2nd sess.,
			H. Doc. 326, 61st Cong., 2nd sess.
	Jul. 3, 1930	Eureka Channel 20 feet deep and 300 feet wide; Samoa Channel 20 feet deep and 250 feet wide; Arcata Channel 18 feet deep and 150 feet wide; Fields Landing Channel 20 feet deep and 250 feet wide.	H. Doc. 755, 69th Cong., 2nd sess.
	Aug. 30, 1935	Entrance Channel 30 feet deep and 500 feet wide.	Rivers and Harbors Committee Doc. 14
			74th Cong., 1st sess
	Aug. 26, 1937	Eureka Channel 26 feet deep and 400 feet wide; Samoa Channel 26 feet deep and 300 feet wide;	Rivers & Harbors Committee, Doc.

		Fields Landing Channel 26 feet deep and 300 feet wide; Turning Basin (off Fields Landing wharf) channel 26 feet deep, 600 feet wide and 800 feet long.	11, 75th Cong., 1st sess.
	Jul. 16, 1952	Bar & Entrance Channel 40 feet deep, tapered from 1,600 feet to 500 feet wide; North Bay Channel 30 feet deep and 400 feet wide; Eureka Channel 30 feet deep to mile 5.0; Samoa Channel 30 feet deep.	Rivers & Harbors Committee, Doc. 143, 82nd Cong., 1st sess.
	August 1968	North Bay Channel 35 feet deep; Samoa Channel 35 feet deep; widen turns at mile 0.75 and 2.6; provide a 1,200 by 1,200 foot anchorage in North Bay.	H. Doc. 330, 90th Cong., 2nd sess.
	Oct. 12, 1996	Bar and Entrance Channel 48 feet deep; North Bay Channel, Samoa Channel and Samoa Turning Basin 38 feet deep; widen the north side of the Entrance Channel an additional 200 to 275 feet; relocate the southern edge of the Entrance Channel away from the South Jetty and to the north by 100 feet; and widen and realign the entrance to the Samoa Turning Basin.	Section 10, Public Law 104-303, 1996 WRDA
3.		OAKLAND HARBOR, CA	
	June 23, 1874	Jetties.	Annual Report, Part II, 1874, P. 378.
	June 25, 1910	North channel in Brooklyn Basin, 25 feet deep, and tidal canal to 18 feet.	H. Doc. 647, 61st Cong., 2d sess.
	Sep. 22, 1922	Channel across shoal southeast of Yerba Buena Island and thence to Webster St.; South channel in Brooklyn Basin; Turning Basin at east end of Brooklyn Basin; and channel in Tidal Canal from Brooklyn Basin to Park St., 30 feet deep.	H. Doc. 144, 67th Cong., 2d sess.
	Jan. 21, 1927 ²	Channel from Webster St. to Brooklyn Basin, maintain area to within 75 feet of pierhead line south of channel from Harrison St. to Harbor Line Point 119 in Brooklyn Basin; dredge a triangular strip about 2,700 feet long and maximum width of 300 feet at western end of Brooklyn Basin, 30 feet deep.	H. Doc. 407, 69th Cong., 1st sess. ¹
	Apr. 28, 1928	Local cooperation requirements modified to provide alteration or replacement of bridges by local interests shall apply only to that feature of project covering deepening tidal canal to 25 feet. Drawbridges across Tidal Canal were required by 1882 Decree of Court in condemnation proceedings whereby title was obtained to right-of-way for tidal canal.	Public Res. 28, 70th Cong.
	July 3, 1930	Entrance channel to outer harbor, 800 to 600 feet wide.	Rivers and Harbors Committee Doc. 43, 71st Cong., 2nd sess.
	Mar. 2, 1945	Eliminated requirement that local interests contribute 10 cents per cubic yard toward deepening tidal canal.	Doc. 466, 77d Cong., 1st sess.
	Mar. 2, 1945	Maintenance of 35-foot depth in channel to outer harbor and in outer harbor channel and turning basin.	Report on File in Office, Chief of Engineers
	Oct. 23, 1962 ³	Deepen inner harbor 35-foot channels and lower 1,300 feet of north channel in Brooklyn Basin to 35 feet.	H. Doc. 353, 87th Cong., 2d sess. ¹

TABLE 34-B (Cont'd)

AUTHORIZING LEGISLATION

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

See Section in Text	Date of Authorizing Act	Project and Work Authorized	Documents
	Nov. 17, 1986	Deepen Inner and Outer Harbor channels to 42 feet. Widen entrance channel to 1,000 feet; relocate Outer Harbor turning basin 3,000 feet westward and widen turning basin to 1800 feet. Construct 1,200 foot turning basin in Inner Harbor.	Public Law 99-662, 1986 WRDA
	Aug. 17, 1999	Deepen Inner and Outer Harbor channels to 50 feet. Widen Outer Harbor turning basin diameter to 1650 feet and widen Inner Harbor turning basin diameter to 1500 feet.	Public Law 106-53, 106 th Cong., 1999 WRDA
4.		RICHMOND HARBOR, CA	
	Aug. 8, 1917	Channel 24 feet deep and 600 feet wide from San Francisco Bay to Ellis Slough (Santa Fe Channel); a turning basin at Point Potrero; a training wall.	H. Doc. 515, 63rd Cong., 2d sess.
	July 3, 1930	A 30-foot channel with lessened widths; a turning basin at head of navigation.	Rivers and Harbors Committee Doc. 16, 70th Cong., 1st sess.
	Aug. 30, 1935 ⁴	Increase project widths in inner harbor, maintenance of Santa Fe channel to 30 feet; approach areas in outer harbor to 32 feet.	Rivers and Harbors Committee Doc. 7, 73rd Cong., 1st sess., and 10, 74th Cong., 1st sess.
	June 20, 1938	Widen channel at Point Potrero and north thereof; enlarge and maintain to 30-foot depth turning basin at Terminal No. 1.	H. Doc 598, 75th Cong., 3rd. sess.
	Mar. 2, 1945	Channel 20 feet deep, 150 feet wide, in San Pablo Bay north of Point San Pablo.	H. Doc. 715, 76th Cong., 3rd. sess.
	Sep. 3, 1954	Channel 35 feet deep and 600 feet wide adjacent to Southampton Shoal; enlarge and deepen to 35 feet approach area to Richmond Long Wharf; widen and deepen inner harbor and entrance channels; deepen turning basin at Point Richmond and southerly 2,000 feet of Santa Fe Channel. Eliminate restriction that widening north of Point Potrero will not be undertaken until local interests furnish assurances industries will avail themselves of improved navigation facilities and reclamation of Reservation Point.	H. Doc. 395, 83rd Cong., 2nd sess. ¹
	Oct. 27, 1965	West Richmond channel 45 feet deep, 600 feet wide; enlarge and deepen to 45 feet maneuvering area at Richmond Long Wharf (Sacramento Dist. "San Francisco Bay to Stockton, Calif. (John F. Baldwin and Stockton Ship Channels)").	H. Doc. 208, 89th Cong., 1st sess. ¹
	Nov. 17, 1986	Deepen channel to 38 feet between Richmond Long Wharf and Santa Fe Channel. Construct 1,200 feet turning basin.	Public Law 99-662, 1986 WRDA

SAN FRANCISCO, CA, DISTRICT

7.	SONOMA BAYLANDS WETLANDS DEMONSTRATION PROJECT, CA		
	Oct. 5, 1992	Restoration of tidal wetland on a 348-acre site using dredged material and construction of a replacement levee around the landward periphery of the site.	Section 106, Public Law 102-580, 1992 WRDA
13.	CORTE MADERA CREEK, CA		
	Oct. 23, 1962	Levees and channel improvements, lower 11 miles of Corte Madera Creek and tributaries, as modified by Chief of Engineers.	H. Doc. 545, 87th Cong., 2nd sess.
	Nov. 7, 1966	Local cooperation requirements modified to provide 1.5 percent cash contribution toward cost of Ross Valley unit.	Sec. 204, 1966 Flood Control Act
	Nov. 17, 1986	Modify existing project to direct construction of Unit 4 from Lagunitas Road Bridge to Sir Francis Drake Boulevard, and to include construction of floodproofing measures in vicinity of Lagunitas Road Bridge to insure proper functioning of completed portions of authorized project. Further modify project to eliminate any channel modifications upstream of Sir Francis Drake Boulevard.	Sec. 823, 1986 WRDA
15.	PETALUMA RIVER, CA		
	Jun. 30, 1948	Floodwalls and channel improvements along 3,600 feet of the Petaluma River and tributaries.	Flood Control Act of 1948, Public Law 80-858, 80th Cong., 2nd sess.
	Jan. 24, 2000	Provide a 100-year level of flood protection to the city of Petaluma.	Public Law 106-541, 106 th Cong., 2d sess., 2000 WRDA
16.	RUSSIAN RIVER BASIN, CA		
	May 17, 1950	Coyote Valley Dam (Lake Mendocino): Channel improvements on lower 98 miles of Russian River and lower reaches of tributaries.	H. Doc. 585, 81st Cong., 2d sess.
	Feb. 10, 1956	Increased appropriation authorization for initial stage of project development.	PL 404, 84th Cong., 2d sess.
	Oct. 23, 1962	Dry Creek (Warm Springs) Lake; Channel Improvements on Dry Creek below dam.	H. Doc. 547, 87th Cong., 2d sess.
	Mar. 7, 1974	Dry Creek (Warm Springs) Lake and channel; compensate for fish losses on the Russian River which may be attributed to the operation of the Coyote Dam component of the project through measures such as possible expansion of the capacity of the fish hatchery at the Warm Springs Dam component of the project.	Sec. 95, 1974 WRDA
22.	HAMILTON AIRFIELD WETLANDS RESTORATION, CA		
	Aug 17, 1999	Implement an ecosystem and wetland restoration project at the Hamilton Army Airfield and adjacent properties and lower reaches of tributaries.	Public Law 106-53, 106 th Cong., 1999 WRDA

	SAN FRANCISCO, CA, DISTRICT		
23.	SAN RAMON VALLEY RECYCLED WATER, CA		
	Oct 31, 1992	Provide assistance to non-Federal interests for carrying out water-related environmental infrastructure and resource protection and development projects described in subsection (c), including wastewater treatment and related facilities and water supply, storage, treatment, and distribution facilities.	Public Law 102-580, Appendix A, Sec. 219 WRDA
	Aug 17, 1999	Provide assistance for construction for recycled water.	Public Law 106-53, 106 th Cong., 1999 WRDA
17.	UPPER GUADALUPE RIVER, CA		
	Aug 17, 1999	Construction of the locally preferred plan for flood damage reduction and recreation, Upper Guadalupe River, California, described as the Bypass Channel Plan of the Chief of Engineers dated August 19, 1998, at a total cost of \$140,328,000, with an estimated Federal cost of \$44,000,000 and an estimated non-Federal cost of \$96,328,000.	Public Law 106-53, 106 th Cong, 1999 WRDA

1. Contains latest published map.
2. Included deepening of tidal canal above Park Street Bridge to 25 feet, which was deauthorized November 6, 1977.

3. Reconstruction of Fruitvale Avenue Highway Bridge (S. Doc. 75, 87th Cong., 2d sess.) which was deauthorized November 6, 1977.
4. Included in part in Public Works Administration Program, September 6, 1933.

1. Exclusive of \$1,628,000 for recreation facilities at completed projects.

SACRAMENTO, CA DISTRICT

PROJECTS SPECIFICALLY AUTHORIZED UNDER THE FORMER CALIFORNIA DEBRIS COMMISSION

The California Debris Commission, consisting of three Corps officers appointed by the President with the consent of the Senate, created by act of March 1, 1893 (27 Stat. L., p. 507), was organized in San Francisco, CA, on June 8, 1893, and has jurisdiction and duties extending over drainage area of Sacramento and San Joaquin Rivers, comprising great central valley of California and extending from crest of the Sierra Nevada on the east to that of the Coast Range on the west, and from Mount Shasta and Pit River Basin on the north to Tehachapi Mountains on the south. These rivers empty into head of Suisun Bay ultimately discharging into the Pacific Ocean through connecting bays and straits and the Golden Gate. Duties of the Commission comprise regulation of

hydraulic mining in drainage area of Sacramento and San Joaquin Rivers, CA, so that debris will not be carried into navigable waters or otherwise cause damage; jurisdiction over construction and control of water storage facilities for domestic, irrigation, and power development purposes; and direction of improvements for control of floods on Sacramento River. On November 19, 1986, the Commission was abolished by the Water Resources Development Act of 1986 (PL 99-662) and all authorities, powers, functions, and duties were transferred to the Secretary of the Army. All acquired lands and other interests presently under jurisdiction of the Commission were authorized to be retained and administered under direction of the Secretary.

Navigation

1. REGULATION OF HYDRAULIC MINING AND PREPARATION OF PLANS

Location. Operations largely limited to territory between Mount Lassen on the north and Yosemite Valley on the south, on western watershed of Sierra Nevada. (See Geological Survey sheets for the area, 2:5 in number.)

Existing project. Provided for regulating hydraulic mining operations, planning improvement of conditions upon Sacramento and San Joaquin Rivers and their tributaries affected by such operations, and preparation of plans to enable hydraulic mining to be resumed in their drainage areas. In addition, the Secretary of the Army is authorized to enter into contracts to supply storage for water and use of outlet facilities from debris-storage reservoirs for domestic and irrigation purposes and power development upon such conditions of delivery, use, and payment as he may approve. Applications of prospective miners were fully investigated by the former California Debris Commission and permits to operate were issued to those who provide satisfactory debris-restraining basins by construction of suitable dams where necessary or agree to make payment for storage in Government-constructed debris-restraining reservoirs constructed under act of June 19, 1934, as set forth below. For location and description of Government-constructed, debris-restraining reservoirs for general hydraulic mining, see Improvement 2.

Local cooperation. Mine owners bore all expenses incurred in complying with orders of the former Commission for regulation of mining and restraint of debris.

Operations and results during fiscal year. Minor administrative duties were accomplished. Administrative work overlaps that of improvements 2, 3, and 4, hereunder, and that of Sacramento District.

Historical summary. The former Commission received 1,292 applications for hydraulic mining licenses; 1 mine is licensed, but does not use storage behind Government debris dams. Work remaining is, in general, continuation of above or similar

operations.

2. SACRAMENTO RIVER AND TRIBUTARIES, CA (DEBRIS CONTROL)

Location. Project reservoirs are to be constructed in watersheds of Yuba, Bear, and American Rivers, CA (See Geological Survey sheets for basin areas, seven in number.)

Existing project. For description of completed North Fork and Harry L. Englebright projects and authorizing act, see Annual Report for 1975. Initial recreation facilities were provided in FY 1959. Recreation areas at Harry L. Englebright Dam are maintained by the Corps. Recreation areas at North Fork Dam are no longer maintained and operated by Auburn Recreation Park and Parkway District, but have been turned over to the Bureau of Reclamation (known as the Water and Power Resources Service between November 6, 1979, and May 18, 1981) on a permit basis. Total Federal cost of new work for construction of these reservoirs was \$4,646,872, including \$40,000 and \$25,000, respectively, for basic recreation facilities at Englebright Dam and North Fork Dam. Reservoir project sites on Middle Fork of American River and on Bear River have been deauthorized and excluded from foregoing cost. The 90-day Congressional project review period, required by Sec. 12, Public Law 93-251, as amended, ended August 5, 1977, and resulted in deauthorization of that portion of the project. Estimated cost of that portion is \$1,820,000 (1935).

Local cooperation. Fully complied with. Improvements made to facilities at North Fork Dam by Auburn Recreation Park and Parkway District under a lease agreement with the Secretary of the Army and Auburn Boat Clubs (concessionaire) at an estimated cost of \$46,000 since September 1953. On March 1, 1979, lands and waters at North Fork Dam were turned over to the Bureau of Reclamation on a 5-year renewable basis. Permit No. DACW05-4-79-527 was renewed for 5 years on March 1, 1984, March 1, 1989, and on March 1, 1994. Bureau will operate and maintain such use until Auburn project is completed, then a fee transfer will be made. Actual operation and maintenance of the recreation resource is being done by State of California by contract with the Bureau.

Licenses. Under provisions of Contract No. W-1105-eng-2998 with Pacific Gas and Electric Co., (PG&E) (a 1941 contract which expired July 31,

SACRAMENTO, CA DISTRICT

1991) payment was made to Federal Government of \$18,000 per year for first 30 years and \$48,000 per year for the next 20 years in return for use of head at Englebright Dam and generation of hydroelectric power. These funds are now paid to the Secretary of the Army and deposited for return to the Treasury. PG&E obtained a new license, Federal Energy Regulatory Commission License No. 1403-004, issued February 11, 1993, for continued operation of Narrows No. 1 Hydroelectric Project and has entered into a new storage agreement and an operation agreement with the Federal Government (Corps). Payments under new agreement are effective as of Fiscal Year 1993 and will be 8.2 percent of previous fiscal year's total costs for operation and maintenance. License No. 2246, effective April 9, 1970 (date New Narrows power plant was put in operation) was issued by Federal Power Commission (known as the Federal Energy Regulatory Commission since January 9, 1978) to Yuba County Water Agency for hydroelectric power development of Yuba River by the company upstream from Englebright Dam. Under provisions of Contract No. DA-04-167-CIV-ENG-66-95 with Yuba County Water Agency, payment is to be made to the Federal Government of \$100,000 per year for no more than 50 years.

Operations and results during fiscal year.

New work: Maintenance and operation activities continued at Harry L. Englebright Dam at a cost of **\$1,220,194** including recreation facilities. Dam safety assurance studies at Englebright Dam have been completed.

Historical summary. Construction of dams was initiated in 1937; North Fork project was completed and in use at end of FY 1939, and Harry L. Englebright project was completed in January 1941. The two debris-control structures are in good condition. Public use of these reservoir recreation areas greatly overtaxes present capacities. Dam safety assurance studies were initiated at Englebright Dam in FY 1981 and were completed in FY 1987.

3. TREATMENT OF YUBA RIVER DEBRIS SITUATION-RESTRAINING BARRIERS, CA

Location. Works are on Yuba River between Marysville and where the river emerges from the foothills, near Hammonton, some 10 miles easterly from Marysville, or about 9 miles below the

Narrows. (See Geological Survey Topographic map of Sacramento Valley, CA.)

Existing project. For description of completed project and authorizing act, see Annual Report for 1975. Total cost of new work was \$723,259, of which \$361,482 was U.S. funds and \$361,777 required contributed funds by State of California. (For details of project in its original form, see Annual Report, 1917, p. 1810.) In February 1963, center section of dam failed and major rehabilitation of structure was completed in December 1964. Total cost for required rehabilitation was \$1,660,000, of which \$830,000 was Federal cost and \$830,000 required contribution by State of California toward rehabilitation cost. During the December 24, 1964, floodflows on the Yuba River, the rehabilitated Daguerre Point Dam sustained considerable damage. (See 1965 Annual Report, p. 1647 "Operations and results during fiscal year.") The reconstructed portion of the dam completed earlier in December 1964 was undamaged by the flood. Permanent repair of Daguerre Point Dam abutment and fish facilities was completed in October 1965 at a cost of \$447,808 with Federal and required State contributed funds on a matching basis.

Local cooperation. Fully complied with for new work and major rehabilitation work. Total first cost to local interests for new work was \$361,777 (required contribution by State of California). In addition, training walls were built on each bank below Daguerre Point for 11,250 feet and just above Daguerre Point, on the south bank, for 11,000 linear feet by two gold-dredging companies in connection with their dredging operations. To build these training walls would have cost the United States \$450,000 (1902 estimate). Flood channels were also built by gold-dredging companies within confines of project works. Cost to the United States of equally effective works to restrain debris movement would have been more than \$776,000 (1926 estimate). Total costs to local interests for initial and permanent major rehabilitation works were \$830,000 and \$223,904, respectively, (required contribution by State of California). State of California must contribute annually an amount equal to the Federal allotment for maintenance.

Operations and results during fiscal year. Maintenance: Operations consisted of condition and operation studies by hired labor on Yuba River.

Historical summary. Construction of project

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

works was initiated in November 1902. Construction of Daguerre Point Dam was completed in May 1906; diversion of river over dam was completed in 1910; training walls and dikes were completed in 1935. About 149 million cubic yards of debris are held in lower 7 miles of Yuba River between Marysville and downstream end of training walls. About 20 million cubic feet, are confined in river channel by Daguerre Point Dam. Additional millions of yards of loose material are in mine tailing fields adjacent to project training walls in upper 7-mile reach of project. Initial rehabilitation of Daguerre Point Dam begun in Jul) 1963 was completed in December 1964. Contract for permanent rehabilitation of structure was initiated in July and completed in October 1965.

Flood Control

4. SACRAMENTO RIVER, CA

Location. Works covered by this improvement are on Sacramento River and tributaries in north-central California from River Mile (RM) 0.0 to at Collinsville to RM 194.0 above Red Bluff.

Previous project. For details see page 1815 of Annual Report for 1917, page 1995 of Annual Report for 1938, and page 2262 of Annual Report for 1907.

Existing project. Sacramento River flood control project is a comprehensive plan of flood control for Sacramento River and lower reaches of its principal tributaries. The long range program provides bank protection to the water-side levees, tributaries and by-passes within the system. The project solves and prevents levee erosion problems while providing fish and wildlife mitigation features. As a part of this project, some recreational facilities have been provided along the river. The existing Sacramento River levees are seriously threatened by erosion and unless continued corrective measures are taken, levee failures may occur with resultant catastrophic damage and possible loss of many lives. Areas protected by the levees are comprised of over 1 million acres, 50 communities, \$38 billion worth of improvements and approximately 2.3 million people.

Estimated (October 1987) cost for original project (exclusive of supplemental levee improvements), including new work and maintenance, is \$163,925,000 of which \$68,925,000 is Federal cost and \$95 million non-Federal (\$90,050,562 for lands and damages and relocations and \$4,949,438 required contributed funds for levee

construction, bank protection works, and levee setbacks). Of this amount, \$4,939,752 was for new work and \$9,686 for maintenance. Estimated October 2004 total project cost is \$266,600,000, of which \$193,200,000 is Federal and \$73,300,000 is non-Federal. Total estimate includes remedial levee work for Yolo Bypass and Cache Slough (Unit 109) and land acquisition for Little Holland Tract as hydraulic and environmental mitigation in potential projects impacting stages of the Sacramento River, but excludes Sacramento Urban Area; Marysville/Yuba City Area; Mid-Valley Area; Lower Sacramento Area; and Upper Sacramento Area Levee Reconstruction Projects. Colusa Basin Drain and Knights Landing (West Levee) are not incrementally economically feasible, but these sites have been transferred to Upper Sacramento Area. Knights Landing (East Levee) has been included with Mid-Valley Area. In addition to project requirements, local interests constructed several pumping plants for drainage of agricultural and urban land protected by project levees. Some channel clearing work was accomplished by State of California and other local interests to supplement project levee construction. Dredging below Cache Slough and reconstruction of Cache Creek settling basin weir are considered deferred and excluded from foregoing cost estimate. Operation and maintenance of completed project will be responsibility of local interests; as units of project are completed, they are transferred to agencies of State of California for operation and maintenance. Existing project was adopted by 1917 Flood Control Act (H. Doc 81, 62d Cong., 1st sess., as modified by Rivers and Harbors Committee Doc. 5, 63d Cong., 1st sess.), 1928 Flood Control Act (S. Doc. 23, 69th Cong., 1st sess.), River and Harbor Act of 1937 (S. Committee print 75th Cong., 1st sess.), and 1941 Flood Control Act (H. Doc. 205, 77th Cong., 1st sess.).

Phase I - Sacramento River Flood Control System Evaluation recommended reconstruction of 32 miles of Sacramento area levees. Report was approved and in March 1989, Sacramento Urban Area Levee Reconstruction project was established under authority of Sacramento River Flood Control Project. New project is located within boundaries of Sacramento River Flood Control System in highly urbanized area around city of Sacramento, near confluence of Sacramento and American Rivers. It includes reconstructing the Left Bank levees of the Sacramento River from the Natomas Cross Canal to the Freeport Bridge by installing 17.1 miles of slurry wall, 5.7 miles of stability berm and drainage blanket,

SACRAMENTO, CA DISTRICT

and reconstructing 2.0 miles of flood walls. It also includes reconstructing the Right Bank levees of the Sacramento River from the Barge Canal to Riverview b) constructing 2.7 miles of stability berm and drain blanket, restoring levee cross-section for 1.0 mile, and developing about 123 acres of fish and wildlife mitigation. Estimated (October 2005) cost for Sacramento Urban project is \$42,900,000 of which \$28,215,000 is Federal and \$14,685,000 is non-Federal (including a cash contribution of \$2,135,000).

Sacramento River Flood Control Project (Glenn-Colusa Irrigation District) (G.C.I.D.) is part of the fishery/irrigation enhancement project being developed by G.C.I.D. The project is located between RM 202 and 206 on the Sacramento River near the Glenn-Tehama county line. The need for additional work near River Mile 208 was also reviewed. Since 1970, flood flows in the Sacramento River have altered the river channel and lowered the water surface at the Glenn-Colusa Irrigation Hamilton City pumping plant. Changing conditions cause significant adverse impacts to river stability, water supply and anadromous fishery resources in the area. The gradient facility (GF) includes use of multiple sheet piles coupled with stone to replicate a natural riffle in the river to restore river hydraulic gradient to approximate pre-1970 conditions. Concurrently, GCID, the Bureau of Reclamation and the State of California built new screens at the pumping plant. Estimated (October 2006) project cost is \$37,130,000, of which \$20,350,000 is Federal and \$6,780,000 is non-Federal. Project was established under authority of the 1917 Sacramento River Flood Control Project (see Energy and Water Development Appropriations Act of 1990 and Water Resources Development Act of 1996 and 1999).

Phase II - Marysville/Yuba City Area Levee Reconstruction. Project is located within boundaries of the Sacramento River Flood Control System in Butte, Sutter and Yuba counties in north-central California. Area includes Feather and Yuba Rivers and their tributaries, Sutter Bypass, cities of Marysville and Yuba City and communities of Linda and Olivehurst. An evaluation of about 134 miles of Sacramento River Flood Control Project levees in Marysville/Yuba City area identified about 30 miles of levees as being structurally unstable. Project consists of reconstructing those levees by installing a combination of slurry cut-off wall, toe drain, stability berm, seepage blanket, relief wells, levee freeboard restoration, irrigation ditch relocation, relocation of

drainage pump station, and fish and wildlife mitigation. Estimated (October 2006) project cost is \$51,000,000, of which \$38,250,000 is Federal and \$12,750,000 is non-Federal (including a cash contribution of \$5,067,500). Project was established under authority of Sacramento River Flood Control Project.

Phase III - Mid-Valley Area Levee Reconstruction. Project is located within the boundaries of the Sacramento River Flood Control System in Placer, Solano, Sutter, Yolo and Yuba Counties in north-central California. Area includes the Sacramento and Feather Rivers, Knights Landing Ridge Cut, Sutter and Yolo Bypasses and portions of the Bear River including Yankee Slough, Dry, Cache, Putah Creeks and the Natomas Cross Canal. Communities in the area include Knights Landing, Robbins, Davis and Woodland. An evaluation of about 240 miles of the Sacramento River Flood Control Project levees in the Mid-Valley area identified about 18 miles of levees that are structurally deficient. Project consists of reconstructing about 18 miles of levees by installing about 15.1 miles of slurry walls, replacement of 1.2 miles of unsuitable levee embankment on landside, relocation of drainage ditches, restoration of levee height, and developing about 17 acres of fish and wildlife mitigation. Estimated (October 2006) project cost is \$44,050,000, of which \$33,100,000 is Federal and \$10,950,000 is non-Federal (including a cash contribution of \$6,526,000). Project was established under authority of the Sacramento River Flood Control Project.

Phase IV - Lower Sacramento Area Levee Reconstruction. Project is located within the boundaries of the Sacramento River Flood Control System in Sacramento, Solano, and Yolo Counties in north-central California. Area includes the lower Sacramento River and its distributary sloughs and the city of Clarksburg. An evaluation of about 295 miles of the Sacramento River Flood Control Project levees in the Lower Sacramento area identified about 47 miles of levees that are structurally deficient. Project consists of reconstructing about 2.6 miles of levees by installing landside berms with toe drains, backfilling of existing drainage collector systems, slurry cut-off walls, the restoration of levee height, and fish and wildlife mitigation. Estimated (October 2005) project cost is \$5,150,000, of which \$3,930,000 is Federal and \$1,220,000 is non-Federal (including a cash contribution of \$640,000). Project was established under authority of Sacramento River Flood Control

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

Project.

Phase V - Upper Sacramento Area Levee Reconstruction. Project is located within the boundaries of the Sacramento River Flood System in Colusa, Glenn, Sutter, and Yolo Counties in north-central California. Area includes the upper Sacramento River and its tributaries and the city of Colusa. An evaluation of about 350 miles of the Sacramento River Flood Control Project levees in the Upper Sacramento area identified about 12 miles of levees that are structurally deficient. Project consists of reconstruction of about 3.7 miles of levees by installing landside berms with toe drains, slurry cut-off walls, the restoration of levee height, and fish and wildlife mitigation. Estimated October 2006 project cost is \$14,380,000 of which \$10,760,000 is Federal and \$3,620,000 is non-Federal (including a cash contribution of \$2,150,000). Project was established under authority of Sacramento River Flood Control Project.

Operations and results during fiscal year.

New work: (a) Sacramento Urban Area Levee Reconstruction: Construction is complete, however, final payment and contract close-out activities remain. (b) Sacramento River Flood Control Project (Glenn Colusa Irrigation District (G.C.I.D.)): Construction was complete on riffle restoration on Sacramento River including building of multiple sheet piles coupled with stone to replicate natural riffle and bank protection to restore river hydraulic gradient to approximate pre-1970 conditions. Concurrently, GCID, The Bureau of Reclamation and the State of California are designing a project to build new screens near GCID pumping facilities. Subsequent to original authority in FY90 EWDA, sponsor selected a flat screen design and determined that a larger gradient facility was required for proper operation of the fish screens. As a result, an LRR and ROD for the larger facility was approved in April 1998. Plans and specs were initiated in January 1999. The Project Cooperation Agreement was executed in December 1999. The Gradient Facility construction contract was awarded in February 2000. The mitigation contract was awarded August 2002. West Bank mitigation installation completed November 2003. Revegetation Contract completed January 2006. O&M work for West Bank mitigation to continue. (c) Marysville/Yuba City Area Levee Reconstruction: Scheduled construction activities are 100% complete. Construction activities associated with extension of Site 7 were completed in November, 2004. Mitigation site monitoring and project closeout

activities remain. (d) Mid-Valley Area Levee Reconstruction: Construction for Area 1 is complete. Continued work on a limited reevaluation report for the second Project Cooperation Agreement for Areas 2, 3 and 4. (e) Lower Sacramento Area Levee Reconstruction: LRR updating the economic justification for Sites 2 and 3 was completed in November 2002. Construction of Site 2 was completed in October 2003. Additional reconstruction is not currently anticipated due to a lack of non-Federal interest. (f) Upper Sacramento Area Levee Reconstruction: In accordance with Section 215 agreement signed September 22, 1997, local sponsor constructed 1,000 lineal feet of seepage/stability berm along the Sacramento River (Site E). LRR updating the economic justification for the project was completed in September 2002. Construction of Site D was completed in December, 2002. Construction of first phase at Site E was completed in December 2003. The final reconstruction contract at Site E was awarded in September 2004 and completed in August 2005.

Historical summary. Construction of existing project began in FY 1918 and is about 99 percent complete. Channel improvement to date has produced a channel with a capacity of 579,000 cubic feet per second in Sacramento River below Cache Slough. In addition, discharges up to 21,000 cubic feet per second can be diverted from Sacramento River through Georgiana Slough. Completed major project items include about 977 miles of levees; five weirs with a combined discharge capacity of 602,000 cubic feet per second; two cutoff channels; two sets of outfall gates; channel improvement and clearing in Sacramento River, Butte Creek, Putah Creek, and Sutter and Tisdale Bypasses; construction of two main bypasses or floodways and secondary bypasses at Tisdale and Sacramento weirs and at Wadsworth Canal; construction of Knights Landing ridge cut and of Cache Creek settling basin; installation of gauging stations; and enlargement of Sacramento River below Cache Slough. Cutoffs at Collins Eddy and between Wild Irishman and Kinneys Bends were made in 1918 and 1919, respectively. Sacramento weir was completed in 1917, Fremont weir in 1924, Tisdale and Moulton weirs in 1932, and Colusa weir in 1933. Outfall gates at Knights Landing were constructed in 1930 and at mouth of Butte Slough in 1936. Pumping plants on Sutter Bypass were completed in 1944. Work items with reference to clearing, snagging, rectification of channels, and bank protection on Sacramento River and tributaries in Tehama County and from Red Bluff southerly, provided for by 1941

SACRAMENTO, CA DISTRICT

Flood Control Act were accomplished in fiscal years 1947, 1948, 1949, and 1951. Yolo Bypass and Cache Slough (Unit 109) was completed in 1990. Work

remaining comprises completion of levee stage construction Mid-Valley Area; Lower Sacramento Area; and Upper Sacramento Area Levees.

(Federal Funds)						

1. Exclusive of \$644,503 appropriation and cost on inactive portion of project.

2. Includes \$477,127 for recreational facilities at North Fork (\$32,473) and Harry L. Englebright (\$414,654), Code 710 appropriations and costs.

3. Includes \$18,624,940 from regular funds and \$2,195,553 from Hydraulic Mining in California funds.

4. Includes \$18,531,375 from regular costs and \$2,163,813 from Hydraulic Mining in California costs.

5. Includes \$12,420 contributed funds, other, from State of California Department of Navigation and Ocean Development for acquisition of a boarding float; and \$311,000 funds from State of California Department of Boating and Waterways for refurbishing restrooms and launching facilities at Englebright Dam.

6. Includes \$12,420 costs for acquisition of boarding float and \$280,317 costs for refurbishing restrooms and launching facilities at Englebright Dam.

7. Includes deferred maintenance funds in amount of \$207,500.

8. Miscellaneous engineering and construction accomplished at expense of local interests in connection with rehabilitation of Daguerre Point Dam necessitated by December 1964 floodflows. Includes \$2,000 from Yuba County Water Agency in May 1994.

9. Includes appropriation and cost of \$680,000 for new work for previous project and \$1,486,469 public works funds for new work for existing project.

10. Includes \$680,000 required contribution for previous project; \$4,939,752 required contributed funds for existing project; and \$310,801 voluntary contribution for bank protection for existing project.

11. Includes \$9,686 required contributed funds for existing project.

12. Includes contributed funds, other, from the State of California for relocation of utilities, irrigation ditch, access ramps, and miscellaneous small structures in the Natomas, Greenhaven Pocket and West Sacramento areas. (Sacramento Urban Area).

13. Includes \$1,328,842 contributed funds, other cost for relocations of utilities, irrigation ditch, access ramps, and miscellaneous small structures in the Natomas, Greenhaven Pocket, and West Sacramento areas.

14. G.C.I.D. construction funds received in FY 1991, but no costs were incurred. Includes \$493,000 total funds and costs under General Investigations for Preconstruction Engineering and Design.

15. Not reflected in actual annual accounting records for Marysville/Yuba City are \$1,710,000 costs for FY 91 and FY 92 incurred under Sacramento River Flood Control Project for design effort. These costs are considered part of Marysville/Yuba City cost-shared project.

SACRAMENTO, CA DISTRICT

TABLE 35-BB

AUTHORIZATION LEGISLATION

See Section in Text	Date of Authorization Act	Project and Work Authorized	Documents
1.	REGULATION OF HYDRAULIC MINING AND PREPARATION OF PLANS		
Mar. 1, 1893	Created California Debris Commission and authorized:(a) Hydraulic mining under its regulation in drainage areas of Sacramento and San Joaquin Rivers, if possible without injury to navigability of these river systems or to lands adjacent thereto; and (b) preparation of plans by Commission for improvement of navigability of these river systems, and flood and debris-control therein.	Ex. Doc. 267, 51st Cong., 2d sess., Ex. Doc. 98, 47 th Cong., 1 st sess. i	
Feb 27, 1907	Authorized California Debris Commission to permit hydraulic mining without construction of impounding works, provided there is no injury to navigability of above river systems or :lands adjacent thereto.	(Amendment of sec. 13, Act of Mar. 1, 1893.) i	
June 19, 1934	Amended act of Mar. 1, 1893, which provides for construction of debris dams or other restraining works by California Debris Commission and collection of a3-percent tax on gross proceeds of each mine using such facilities, so as to eliminate this tax and substitute an annual tax per cubic yard mined, obtained by dividing total capital cost of each dam, reservoir, and rights-of-way, by total capacity of reservoir for restraint of debris; and authorized revocation of Commission orders permitting such mining, for failure to pay this annual tax within 30 days after its due date; and also authorized receipt of money advances, from mine owners to aid such construction, to be refunded later from annual payments of yardage taxes on material mined.		
June 25, 1938	Added at end of sec. 23 of above act, a provision that the Secretary of the Army is authorized to enter into contracts to supply storage for water and use of outlet facilities from debris-storage reservoirs for domestic and irrigation purposes and power development, upon such conditions of delivery, use, and payment as he may approve, these payments are to be deposited to credit of such reservoir project, reducing its capital cost to be repaid by tax on mining operations.		
Nov. 17, 1986	Abolished the California Debris Commission and transferred all authorities, powers, functions, and duties to the Secretary of the Army. Authorized all acquired land and other interests presently under jurisdiction of the Commission to be retained and administered under direction of the Secretary.	Sec. 1001, 1986 WRDA

4.		SACRAMENTO RIVER, CA	
	Dec. 22, 1944 and May 17, 1950	Additional levee construction and reconstruction, including levee protection of Upper Butte Basin, and multipurpose reservoirs. 2	H. Doc. 649, 78 th Cong., 2d sess., and 367, 81 st Cong., 1 st sess.
	July 3, 1958	Bank protection and incidental channel improvements, Sacramento River from Chico Landing to Red Bluff, and local interests flood plain zoning above Chico Landing. 2	H. Doc. 272, 84 th Cong., 2d sess.
	July 14, 1960	Bank protection works at critical locations, Sacramento River. 2	S. Doc. 103, 86 th Cong., 2d sess.
	May 24, 1994	Acquiring and permanently restoring Little Holland Tract to tidal lands with seasonal and emergent marshlands would not only have substantial environmental benefits, but measurable flood control benefits as well.	H. Doc. 533, we Cong., 2d sess.

1. For latest published map, see Annual Report for 1913, p. 3170, and Rivers and Harbors Committee Document 50, 74th Cong., 1st sess. 2. This supplemental work is reported in detail under Sacramento District, Improvement No. 23.

Albuquerque, NM, District*

The district comprises the watershed of the Canadian River and its tributaries in New Mexico; the watershed of the Arkansas River and its tributaries in Colorado; the watershed of the Rio Grande and its tributaries, including the Pecos River and its tributaries upstream of Amistad Lake; and the San

Juan River Basin in New Mexico; and the watershed of the Gila, San Francisco, and Mimbres Rivers and its tributaries in New Mexico. Note: The district watershed boundaries were revised in June 1986 to include the portion of New Mexico west of the Continental Divide.

Flood Control

1. ACEQUIAS IRRIGATION SYSTEM, NM

Location. There are about one thousand Acequias throughout the state of New Mexico, most of which are located in north-central New Mexico.

Proposed project. Authorized by the Water Resources Development Act of 1986, Section 1113, the project consists of about one thousand acequias throughout the state of New Mexico. These community ditch systems provide irrigation water to about 160,000 acres on an estimated 12,000 farms.

Acequias have been in existence since the early Spanish Colonization period of the 17th and 18th Centuries, and represent one of the oldest forms of cooperative institutions in the United States. They are an integral part of the culture and heritage of New

Mexico. Diversion structures, many of which are constructed of available materials such as rock and brush, are frequently destroyed by flows greater than normal resulting from spring runoff or summer thunderstorms. Disruption of the ditches usually occurs during peak irrigation season and severely impacts crop production. The Water Resources Development Act of 1986 directs the U.S. Army Corps of Engineers to undertake measures, without regard to economic analysis, as are necessary to protect and restore the river diversion structures and associated canals.

Local cooperation. The local sponsor, the State of New Mexico, has a law whereby the State of New Mexico provides 17.5% of the project costs, and low interest loans to the local Acequias for the remaining 7.5%. The State of New Mexico has appropriated, and will appropriate, on an annual basis, the funds

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

necessary to meet the requirements of local sponsorship.

Operations and results during fiscal year. Funds to initiate construction were received in Fiscal Year 1988. Construction contracts have been awarded every year since FY 1988.

Condition at end of fiscal year. There are several projects in various stages of design and construction. Projects completed in FY 2007 include: Los Utes, Ancones, Mulcock – Foley – Powell and Turley - Manzanaras.

2. ALAMOGORDO, NM

Location. The project is located in south-central New Mexico in Otero County, in and near Alamogordo, NM. The city is situated at the foot of the Sacramento Mountains near the eastern edge of the Tularosa Basin.

Proposed project. The authorized project consists of two concrete and riprap-lined diversion channels with 100-year flow capacity and a flood detention structure, which will intercept flows from the Sacramento Mountains east of the city. For a description of the complete improvement and authorizing legislation, see page 694 of Annual Report for 1966.

Local cooperation. The local cooperation agreement reflects the cost sharing requirements in the Water Resources Development Act of 1986 applies.

Condition at end of the fiscal year. Construction of Phase I of the South Diversion Channel was completed in June 2002. Construction of Phase II was completed in May 2005. Construction of Phase III is scheduled to complete in December 2007. Phase IV was awarded in May 2007.

3. CONCHAS DAM, NM

Location. The dam is located in San Miguel County, NM, on the Canadian River, just below the confluence of the Canadian and Conchas Rivers. (See Geological Survey State Map of New Mexico, scale 1:500,000, and Geological Survey topographic map, Tukumcari quadrangle, scale 1:250,000).

Existing project. The dam consists of a concrete gravity main section 1,250 feet long with a maximum height of 200 feet above streambed, located in the

Canadian River canyon together with earth dikes on each side, having an overall length of about 3.07 miles. The main section contains conduits in its base for the release of water from the reservoir, and an overflow ungated spillway 300 feet long. The earth dikes vary in height up to 100 feet and the north dike contains a concrete ogee-type emergency spillway 3,000 feet long. The reservoir has a gross storage capacity of 513,900 acre-feet (198,170 for flood control; 254,200 for water conservation and irrigation; and 61,530 dead storage). The dam controls 7,409 square miles of drainage area. (See pages 17-16 of Annual Report of 1973 for authorizing legislation).

Local cooperation. None needed.

Operations and results during fiscal year. The reservoir was operated for storage of floodwater and releases for irrigation purposes. Sediment damages of \$58,700 were prevented during FY 2007. There were no flood damages prevented in FY 2007. Estimated total accumulated flood and sediment damages prevented by the project through FY 2007 are \$5,302,200. Estimated irrigation benefits for FY 2007 are \$115,200. Estimated total accumulated irrigation benefits through FY 2007 are \$12,365,000. The pool elevation at the start of FY 2007 was 4,178.93 feet with corresponding storage of 154,880 acre-feet. Total releases for this reporting period were 58,505 acre-feet. Sediment deposition during the fiscal year was 524 acre-feet.

Condition at end of the fiscal year. Automation of the gates at the irrigation head works was completed in FY 2006.

4. EL PASO, TX

Location. The project is located at El Paso, El Paso County, TX, which is on the left bank of the Rio Grande in the reach that forms part of the international boundary between the United States and the Republic of Mexico. (Geological Survey Map for El Paso, TX; New Mexico quadrangle, scale 1:250,000).

Existing project. This project consists of a single-purpose flood control system of detention dams, diversion dikes, conduits, and channels to collect, regulate and discharge arroyo runoff into the Rio Grande. Runoff from the tributary arroyos on the eastern, southern, and western slopes of the adjacent Franklin Mountains often inundates sections of the

ALBUQUERQUE, NM, DISTRICT

city and its outlying suburban developments. The project is divided up into three independent elements: Northwest area, Central area, and Southeast area. The project plan satisfies the 1933 U.S. and Mexico agreement on limited tributary discharge into the Rio Grande in El Paso, Texas. (See Table 36-B for authorizing legislation).

Local cooperation. Section 2 of the Flood Control Act of June 28, 1938 applied to the Northwest and Central areas. The Local Cooperation Agreement for the Southeast area reflects the cost sharing requirements contained in the Water Resources Development Act of 1986.

Operations and results during fiscal year. Flood control dams in operation during FY 2006 and dates of completion of construction are as follows: Northgate and Range Dams (February 1970; Sunrise and Mountain Park Dams (October 1974); and Pershing Dam (March 1977); Fort Bliss Diversion Channel (November 1978); Oxidation Pond Outlet Conduit (November 1980); Mulberry and Thorn Drive Dams (June 1982); Mesa Dam (September 1982); McKelligon Canyon Dam (October 1982); Keystone Dam (September 1983); Keystone Outlet Conduit (March 1984); Highway Diversion Channel (May 1985); Dam Safety Assurance Program to the existing Range and Northgate Dams (September 1986); Borderland Diversion Channel (September 1986); Phelps Dodge system (June 1992); Americas Basin (March 1993); Bluff Channel (October 1998) and the Lomaland system in November 2004.

Condition at end of the fiscal year. Project features already constructed in the El Paso area have worked as designed. A letter of intent from the City of El Paso was received in August 2006 to pursue a General Reevaluation Report (GRR) for the Chevron Basin. This feature was not constructed due to environmental concerns at the site. Alternatives will be developed for the southeast and central area residual flooding in El Paso in the GRR.

5. JOHN MARTIN RESERVOIR, CO

Location. The project is located on the Arkansas River in Bent County, 1,159 miles upstream from its mouth, 300 miles downstream from its source and about 18 miles upstream from the city of Lamar, CO. (See Geological Survey maps for Lamar and Las Animas, CO quadrangle, scale 1:125,000).

Existing project. The project consists of a concrete and earth fill structure about 2.6 miles long with a

maximum height of 120 feet above streambed, and an overflow, gated spillway 1,024 feet long. Total capacity of the reservoir at the top of flood control is 603,465 acre-feet (259,417 for flood control and 344,048 for conservation and recreation storage). This reservoir controls a contributing drainage area of 18,130 square miles and is operated as a unit of a coordinated reservoir system for flood control in the Arkansas River Basin. Public Law 89-298 modified the act of June 22, 1936 (49 Stat. 1570) to authorize 10,000 acre-feet of reservoir flood control storage space for fish and wildlife and recreation purposes. For details of the complete improvement and authorizing legislation, see page 17-16 of Annual Report for FY 1973.

Local cooperation. Section 3 of the Flood Control Act of June 22, 1936 applies.

Operations and results during fiscal year.

Operation of the dam and reservoir continued. Regulation of conservation storage continued under rules and regulations of the Arkansas River Compact. Sediment damages of \$205,400 were prevented during FY 2007. Estimated total flood and sediment damages prevented by this project through FY 2007 are \$140,193,000. Estimated irrigation benefits for FY 2007 are \$257,800. Estimated total accumulated irrigation benefits are \$30,902,700. Maximum pool elevation of 3,820.61 feet with corresponding storage of 89,338 acre-feet occurred on June 22, 2007. Total releases for FY 2007 were 234,817 acre-feet. Releases attributed to irrigation benefits amounted to 66,604 acre-feet. Sediment deposition was 1,834 acre-feet in FY 2007.

Condition at end of the fiscal year. Replacement of the Tainter Gate Seals and the Reservoir sediment study were completed at John Martin Reservoir in FY 2006.

6. RIO GRANDE BASIN, NM

Location. Improvements are located on the Rio Grande and tributaries in New Mexico. More definitive locations and descriptions of individual projects are in the following paragraphs, and individual reports by projects.

Existing project. The Flood Control Act of 1948 authorized the flood control phase of the comprehensive plan of development of water resources of the Rio Grande Basin in New Mexico (H. Doc 243, 81st Cong., 1st sess.) with the exception of Chiflo Dam and Reservoir and spillway gate

structure at Chamita Dam. Although recommended, Chiflo Dam and Reservoir was deleted from the authorized plan. Congress excluded it without prejudice from future consideration. It was requested at that time, by the States of Colorado and Texas, that the project be deferred for re-study regarding required storage and methods of operation. By the same Act, Congress also authorized for the construction irrigation phase of the comprehensive plan as recommended by the Bureau of Reclamation (H. Doc. 653, 81st Cong., 2nd sess.). The Act also stipulated that work should be prosecuted in accordance with a joint agreement approved by the Secretary of the Army and Acting Secretary of the Interior on November 21, 1957. In addition, under that agreement, the Bureau of Reclamation was given responsibility for construction, operation, and maintenance of channel rectification, and drainage rehabilitation and extension phases of the unified plan of improvement. Authority for the Chamita Dam and Reservoir was abrogated when Cochiti Dam and Reservoir was authorized. (See Table 36-B for authorizing legislation and Table 36-F for existing projects).

All operations and costs for projects contained in the authorized plan are reflected in individual reports on the following pages.

6A. ABIQUIU DAM, NM

Location. The project is one unit of the flood control plan for the Rio Grande and tributaries, New Mexico. Abiquiu Dam is located on the Rio Chama near the town of Abiquiu, NM, about 32 miles upstream from the confluence of the Rio Chama and the Rio Grande. (See Geological Survey map for plan and profile of Rio Chama, NM, from mouth to mile 103, sheet 1, and Army Map Service, Aztec, NM; Colorado NJ 13-1, scale 1:250,000).

Existing project. The project consists of an earth fill dam 1,800 feet long, 341 feet high, with a 12-foot diameter controlled outlet, and an uncontrolled spillway in a natural saddle about 1 mile north of the left abutment. The reservoir provides 545,784 acre-feet of flood control and sediment storage. Total capacity at the spillway crest is 1,192,801 acre-feet. For a detailed description of the completed improvements and authorizing legislation, see Annual Report of 1973. A major rehabilitation project was completed in September 1980 and the recreation facilities were completed in FY 1981. The County of Los Alamos completed a non-Federal hydropower plant in 1990. The capacity of this plant

is 13.2 MW. Drainage adits were completed in 1990 to alleviate seepage problems in the north and south abutments. In 2001 repairs were initiated to the downstream north abutment of the dam where rock movement had been observed. Work continued through 2005. Removal of rock, cutback, rock bolting and some netting has taken place. A study will determine current slope conditions.

Local cooperation. None required.

Operations and results during fiscal year.

Operation of the dam and reservoir continued. Storage and flows were regulated in accordance with Section 203, Flood Control Act of 1960. On October 1, 2006, the pool elevation was 6,212.55 feet. The maximum pool (6,220.84 feet) and storage (187,292 acre-feet) occurred on May 18, 2007. On September 30, 2007, the pool elevation was 6,219.61 feet with a corresponding storage of 182,314 acre-feet. There were 729 acre-feet of sediment deposition during FY 2007. There was \$8,800 in flood damages prevented during FY 2007. Sediment damages prevented were \$81,700. Accumulated flood and sediment damages prevented by the project since completion are \$481,633,700 through FY 2007.

Condition at end of fiscal year. The project was placed in operation in February 1963. The project structures are in good condition and operational.

6B. ALBUQUERQUE LEVEES, NM

Location. The project is located in the City of Albuquerque, NM and surrounding communities. The project study area includes the east side and west side levee areas within the Albuquerque reach of the Middle Rio Grande from the Corrales Siphon North southward to the South Diversion Channel.

Proposed project. Funds were provided to evaluate the existing condition of the levees.

Local Cooperation. None required

Condition at end of fiscal year. The study is complete and concludes that the levee system protecting Albuquerque is in need of reconstruction and rehabilitation. The preliminary costs estimate for this work is \$120,000,000.

6C. COCHITI DAM AND LAKE, NM

Location. The dam is located at river mile 340 on the Rio Grande (river mile 0 being at the intersection

ALBUQUERQUE, NM, DISTRICT

of the New Mexico-Texas state line with international boundary at El Paso, TX), near Pueblo de Cochiti, which is about 50 miles upstream from Albuquerque, NM. (See Geological Survey Map, Cochiti Dam, NM quadrangle and Santo Domingo Pueblo, NM quadrangle, scale 1:24,000).

Existing project. This project consists of an earth fill dam about 5.4 miles long with a maximum height of 251 feet above streambed. The project extends generally in an east-west line across the Rio Grande to a point about 2 miles east of the Rio Grande, and then southward across the Santa Fe River. An uncontrolled spillway with a 460 foot-long ogee-weir and a 160-foot notch 10.6 feet deep in the center is part of the embankment on the south side of the Santa Fe River. Operational releases for flood control and irrigation are made through a 3-barrel gated conduit in the left abutment on the Rio Grande. The reservoir has a storage capacity of 582,019 acre-feet at the spillway crest, of which 78,640 acre-feet is dedicated for recreation and sediment control. The project controls flood waters from an 11,695 square-mile drainage area. For more improvement details, see page 17-7 of Annual Report for 1980. See page 17-15 of fiscal year 1981 Annual Report for authorizing legislation.).

Local cooperation. None required.

Operations and results during fiscal year.

Operation of the dam and reservoir continued. The project was completed in June 1975. On October 1, 2006, the pool elevation was 5,339.71 feet with a corresponding storage of 48,805 acre-feet. The maximum pool elevation was 5,348.98 feet with storage of 62,121 acre-feet on May 19, 2007. On September 30, 2007, the pool elevation was 5,341.21 feet with a corresponding storage of 50,614 acre-feet. There were 774 acre-feet of sediment deposition during FY 2007. There were \$0 flood damages prevented during FY 2007. Sediment damages prevented were \$86,700. Accumulated total damages prevented are \$540,800,400.

Condition at end of fiscal year. The dam and appurtenances were placed in operation in 1975. Project structures are in good condition and in operation. The gate automation design was completed in FY 2006.

6D. GALISTEO DAM, NM

Location. The dam is located at river mile 12 on Galisteo Creek, a tributary of the Rio Grande. The

reservoir extends upstream from the dam for about 4 miles, near the village of Waldo, NM (see Geological Survey map, San Pedro 1, NM, quadrangle, scale 1:24,000).

Existing project. This project consists of an earth fill dam 3,210 feet long with a maximum height of 165 feet above streambed. The outlet works consist of a 10-foot diameter uncontrolled outlet with maximum discharge capacity of 4,980 cubic-feet-per-second with a pool at the spillway crest elevation. The dam was raised 7 feet and the spillway was widened 575 feet to provide adequate discharge capacity to accommodate the revised probable maximum flood. The dam safety modification was complete in October 1998. The project has 89,468 acre-feet of flood control space and 10,200 acre-feet of sediment space. For more details of completed improvements and authorizing legislation, see page 17-17 of Annual Report for 1973).

Local cooperation. None required.

Operations and results during fiscal year.

Operation of the dam and reservoir continued. Operation of the project began on October 11, 1970. The reservoir was empty on October 1, 2006. No storage occurred during FY 2007. Peak inflow was cfs and maximum outflow was 1,290 cfs. There were 9 acre-feet of sediment deposition during the year, and the reservoir was empty on September 30, 2007. Sediment damages prevented during FY 2007 were \$1,000 and now total \$186,200 through FY 2007.

Condition at end of fiscal year. The project was placed in operation in October 1970. The project structures are in good condition and in operation.

6E. JEMEZ CANYON DAM, NM

Location. The project is located in Sandoval County, NM, on the Jemez River, about 2 miles upstream from the confluence of the Jemez River and the Rio Grande, about 5 miles northwest of Bernalillo, NM. (See Geological Survey map for Bernalillo, quadrangle scale 1:125,000).

Existing project. This project consists of an earth fill dam 861 feet-long with maximum height of 149.6 feet above streambed, an off-channel uncontrolled saddle spillway 428 feet wide, and a 13-foot diameter gated outlet in the left abutment with discharge capacity of 8,340 cubic-feet-per-second, with a pool at spillway crest elevation. The dam was raised 14.1 feet and the spillway widened 28 feet in 1986 and 1987 to provide adequate discharge capability to

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

accommodate the revised probable maximum flood. The reservoir has a capacity of 97,425 acre-feet at spillway crest (73,000 acre-feet for flood control and 24,425 acre-feet for sediment control). For more detailed description of completed improvements and authorizing legislation, see page 17-17 of Annual Report for 1973).

Local cooperation. None required.

Operations and results during fiscal year. Jemez Canyon is operated as a dry reservoir, with occasional flood storage. On October 1, 2006, the pool elevation was 5,155.0 feet with a corresponding storage of 0 acre-feet. The maximum pool elevation was 5,155.0 feet with storage of 0 acre-feet on October 1, 2006. On September 30, 2007, the pool elevation was 5,155.0 feet with a corresponding storage of 0 acre-feet. The reservoir was emptied during FY 2002. There was sediment deposition during FY 2007. There were no flood damages prevented during FY 2007. Sediment benefits during FY 2007 were \$0. Estimated total accumulated flood and sediment damages prevented by the project through FY 2007 are \$25,184,500.

Condition at end of the fiscal year. The project was placed in operation in October 1953. Project structures are in good condition. A new American Disability's Act (ADA) restroom was constructed in the Visitor Overlook Area at Jemez Canyon Dam in FY 2006.

6F. MIDDLE RIO GRANDE FLOOD PROTECTION, BERNALILLO TO BELEN, NM

Location. The project area is composed of 50 square miles of floodplain lying along the Rio Grande from the vicinity of Bernalillo to Belen, NM.

Proposed project. The project was authorized by the Water Resources Development Act of 1986. The project consists of raising and rehabilitating 49.6 miles of levees to provide the 270-year level of protection, and the creation of 75 acres of wetlands from borrow areas within the bosque, and acquisition of 200 acres to satisfy fish and wildlife mitigation requirements. The proposed project will be constructed at an estimated total cost of \$77,200,000 (\$57,900,000 Federal and \$19,300,000 non-Federal) 1 Oct 03 price levels. (See Table 36-B for authorizing legislation).

Local cooperation. The local cooperation agreement reflects the cost sharing requirements in the Water Resources Development Act of 1986 applies.

Operations and results during fiscal year.

Construction of the Corrales Unit was completed in July 1997. A General Reevaluation Report study for the remaining units (Mountainview, Isleta, and Belen), is currently underway. The study will update costs, benefits, and environmental impacts of the 1986 authorized project. The General Reevaluation Report is scheduled for completion in 2010.

6G. RIO GRANDE BOSQUE REHABILITATION/ BOSQUE WILDFIRES, NM

Location. The authorized project is located within the city of Albuquerque, New Mexico and surrounding communities. The project area includes the east and west bank of the bosque (forest) along the Rio Grande from Bernalillo to Belen.

Proposed project. The project was authorized by the FY04 Energy and Water Appropriations bill, following severe wildfires that occurred in 2003 in the Rio Grande bosque in and near Albuquerque. The project consists of management measures to reduce the potential for fires in the future and to restore fire damage that occurred in 2003. These measures include, but are not limited to: fuel reduction of dead wood; removal of non-native and invasive species; planting of native species; removal of unnecessary jetty jacks; and improvement of emergency vehicle access points and roads into the bosque.

Local Cooperation. Funding for the implementation effort of this project is 100 percent Federal. The City of Albuquerque, the Middle Rio Grande Conservancy District and the Pueblos of Isleta and Sandia will assume all operation and maintenance costs of the project following implementation.

Condition at end of fiscal year. Design and implementation of management measures continued through FY07. Completion of construction is projected for FY10. Total cost is currently estimated at \$25 million.

6H. RIO GRANDE FLOODWAY, NM

Location. The project is one unit of the flood control phase of the comprehensive plan of improvement for the Rio Grande Basin in New Mexico. It is located on the Rio Grande and covers a section of the river extending from approximately Velarde, New Mexico to Elephant Butte, New Mexico, a distance of approximately 213 miles.

Existing project. The project consists of flood protection and major drainage improvements by channel rectification, levee enlargement and construction, and bank stabilization work where needed to protect the levees. Construction of the project is a joint undertaking by the Bureau of Reclamation and the Corps. Portions to be done by the Corps will consist of levee enlargement, construction of bank protection work, with channel rectification and drainage rehabilitation work being the responsibility of the Bureau of Reclamation. Levees constructed by local interests exist throughout the reach of the river involved, but are not uniform as to grade, section, or standard of construction, and in many places are threatened by the meandering river. (See Table 36-F on existing project and Table 36-B for authorizing legislation).

Local cooperation. In addition to the usual requirements, local interests are responsible for all highway, bridge, and public utility relocations or replacements required in construction of the project. Local interests will also be required to comply with requirements of Section 221, 1970 Flood Control Act, Section 401, 1986 Water Resources Development Act, and PL 91-646 Uniform Relocation Assistance Act of 1970. Total costs for all requirements for the completed Albuquerque unit under terms of project authorization were \$75,000. There were no non-Federal costs in connection with the construction of the Cochiti to Rio Puerco unit of the floodway. The Española Valley unit is in the deferred category.

Operations and results during fiscal year. There were no flood damages prevented by the completed floodway project during FY 2007. Estimated total accumulated flood damages prevented by the floodway project through FY 2007 amounted to \$0. The peak flow of the Rio Grande through the middle valley was 3,900 cfs at Albuquerque on May 21, 2007. The peak at San Acacia was 4,220 cfs on October 08, 2007.

Condition at end of fiscal year. Construction of the Albuquerque unit of the Rio Grande Floodway

project is complete. Construction was completed on the Truth or Consequences unit in FY 1991.

6I. SAN ACACIA TO BOSQUE DEL APACHE UNIT, NM

Location. The authorized project is located along the middle Rio Grande's west bank, extending from the upper end of the Rio Grande low-flow conveyance channel at the San Acacia diversion works to the head of Elephant Butte Reservoir.

Proposed project. The project was authorized by the Flood Control Act of 1948 and consists of the reconstruction of 42 miles of existing spoil bank levee that separates the Rio Grande low-flow conveyance channel from the river floodway and replacing the San Marcial railroad bridge. The proposed project's estimated total cost is \$77,600,000 (\$67,900,000 Federal and \$9,700,000 non-Federal) 1 Oct 97 price levels. (See Table 36-B for authorizing legislation).

Local cooperation. The Water Resources Development Act of 1986 and the Water Resources Development Act of 1992 apply. The Water Resources Development Act of 1992 modified the local sponsor's required contribution.

Condition at end of fiscal year. The draft LRR/SEIS (dated May 99) was sent forward to higher authority for review and approval. Responses to headquarters review comments and action items concerning the draft LRR/SEIS were completed in May 2003. Pending headquarters approval, the final report will be completed in October 2009 with construction starting in September 2011.

7. SANTA ROSA DAM AND LAKE, NM

Location. The project is located in Guadalupe County on the Pecos River, at river mile 766.4, approximately 7 miles north of Santa Rosa, NM (see Geological Survey map, Corazon, NM, sheet, scale 1:125,000).

Existing project. Operation of the project began in November 1979. It consists of an earth and rock fill dam 1,950 feet long and 212 feet maximum height above the streambed. The purposes of this project are flood control, irrigation, and sediment retention. An unlined, open rock cut about 1,000 feet back from the left abutment serves as an uncontrolled spillway. The outlet works, located in the left abutment, consists of a control tower, intake structure with

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

gates, and a 10-foot diameter concrete-lined tunnel with a terminal flip bucket energy dissipater. Storage capacity at the spillway crest is 438,364 acre-feet, which includes 82,860 acre-feet sediment reserve, 200,000 acre-feet irrigation, and 167,000 acre-feet flood control storage. The surface area of the reservoir at the spillway crest is 10,581 acres. The contributing drainage area at the dam site is 2,434 square miles.

For a more detailed report of the authorized project, including the modification to existing Sumner Lake, see page 17-8 of FY 1981 Annual Report. For authorizing legislation, see page 17-14 of FY 1981 Annual Report.

Local cooperation. In addition to first costs, operation and maintenance of both reservoirs is the responsibility of the Federal Government; however, the Carlsbad Irrigation District is required to contribute to operation and maintenance costs an amount equal to what they now pay toward Sumner Lake. The Carlsbad Irrigation District (CID) also agreed to use Sumner Lake for flood control. Because the CID realizes equivalent benefits from storage capacity in Santa Rosa Lake, they will continue to fulfill their repayment obligation. The New Mexico Division of State Parks manages the recreation facilities. Activities include camping, picnicking, boating, and hiking.

For more requirements and details on final approval in 1974 for transfer of irrigation storage from Sumner Lake to Santa Rosa Dam and Lake (formerly Los Esteros Lake), see page 17-5 of Annual Report for 1980.

Operations and results during fiscal year.

Operation of the dam and reservoir continued. Pool elevation at the start of the fiscal year was 4,739.90 feet with storage of 79,562 acre-feet. Total releases for the fiscal year were 60,735 acre-feet. Pool elevation on September 30, 2007 was 4,729.43 feet with storage of 50,566 acre-feet. The maximum elevation was 4,744.26 feet with storage of 94,391 acre-feet on June 22, 2007. There were 262 acre-feet of sediment deposition during the fiscal year. Sediment damages prevented during the fiscal year were \$29,300. Accumulated flood and sediment damages prevented by the project since completion are \$5,706,200 through FY 2007. Estimated irrigation benefits were \$206,800 with an accumulative total of \$4,771,500 through FY 2007.

Condition at end of the fiscal year. The project was complete in late 1979 and reservoir operation for irrigation was started in March 1980. Construction of the recreation area was completed in October 1980. Design studies for spillway modification were initiated in FY 1970, and construction was completed in FY 1982. The project structures are in good condition and in operation.

8. TRINIDAD LAKE, CO

Location. This project is located on the Purgatorie River about 161 miles above its junction with the Arkansas River. The project is about 4 miles upstream from the city of Trinidad, CO. (See Geological Survey map, Trinidad, CO, quadrangle, scale 1:24,000).

Existing project. The project consists of an earth fill dam 6,610 feet long with a maximum height of 200 feet above streambed, an uncontrolled spillway 1,000 feet wide in the left abutment, and a 10-foot diameter gate-controlled conduit in the right abutment with discharge capability of 5,700 cubic-feet-per-second with a water surface at top of the flood control pool. In 1985, a 3-foot high parapet wall on top of the upstream face of the dam and a supplemental 710 foot-wide rock cut emergency spillway located on the right abutment were constructed to provide adequate discharge capability and freeboard allowance to accommodate the revised probable maximum flood. In 1989, the recreation pool was increased from 4,500 to 15,967 acre-feet, utilizing some originally unallocated space in the project. The reservoir provides for storage of 51,000 acre-feet for flood control, 35,045 acre-feet for sediment, 20,000 acre-feet for irrigation, and 17,179 acre-feet for recreation, a total of 123,224 acre-feet. The reservoir controls a drainage area of 671 square miles and is operated for flood and sediment control, irrigation, and recreation purposes. For authorizing legislation, see page 17-14 of FY 1981 Annual Report.

Local cooperation. Assurances of local cooperation received from the City of Trinidad and Purgatorie River Water Conservancy District were formally accepted May 11, 1967, after execution of an irrigation repayment contract. For complete details of requirements and costs pertaining to the execution of the irrigation repayment contract and the addition of permanent storage for recreation facilities, see page 17-9 of Fiscal Year 1980 Annual Report.

Operations and results during fiscal year.

Operation of the dam and reservoir continued. On

ALBUQUERQUE, NM, DISTRICT

October 1, 2006, the pool elevation was 6,169.23 feet with a corresponding storage of 13,516 acre-feet. The maximum pool elevation was 6,195.91 feet with a corresponding storage of 32,173 acre-feet on June 14, 2007. On September 30, 2007, the pool elevation was 6,178.85 feet with a corresponding storage of 19,130 acre-feet. Sediment deposition during FY 2007 was 234 acre-feet. Sediment damages prevented during FY 2007 was \$87,500. Accrued sediment benefits are \$3,073,800. Irrigation benefits for FY 2007 were \$58,200. Accrued irrigation benefits through FY 2007 are \$2,710,000. Irrigation benefit releases for the year were 14,807 acre-feet.

Conditions at end of fiscal year. The project was placed in operation in 1977. The recreation facilities were completed in 1980. The Dam Safety Assurance contract was completed in May 1983. The project structures are good and in operation.

9. TWO RIVERS DAM, NM

Location. The project is located about 14 miles southwest of Roswell, NM on the Rio Hondo and the Rocky Arroyo. The Rio Hondo is formed at the confluence of the Rio Ruidoso and the Rio Bonito, near the village of Hondo, NM, in the foothill region east of Sierra Blanca in the southeastern part of Lincoln County, NM, and flows generally easterly to its confluence with the Pecos River near Roswell, NM. (See Geological Survey map, Hondo Reservoir quadrangle, scale 1:24,000).

Existing project. The Two Rivers project consists of two dams: Diamond "A" and Rocky. The Diamond "A" Dam is an earth fill structure, 4,885 feet long and 98 feet high, with a gated outlet. The Rocky Dam is an earth fill structure 2,940 feet long and 118 feet high with an uncontrolled outlet. No provision is made for water storage, except for flood control. Flood releases are controlled so that flows through Roswell will not exceed the Rio Hondo channel capacity, which are about 600 cubic-feet-per-second. A Dam Safety Reconnaissance Report, approved in June 1996, identified the need to increase the size of the spillway on the left abutment of the Rocky Dam by 1,170 feet in order to accommodate the revised Probable Maximum Flood flows for the Dam. The spillway was widened 1,170 feet in 1998 to provide adequate discharge capability to accommodate the revised probable maximum flood. The capacity of the Two Rivers Reservoir at its spillway crest is 163,773 acre-feet of which 13,775 acre-feet are provided for sediment reserve. Together, these dams regulate runoff from 1,027 square miles of drainage area. For details of completed improvement and

authorizing legislation, see page 17-18 of Annual Report for 1973.

Local cooperation. Section 2 Flood Control Act of 1938 applies and compliance is satisfactory.

Operations and results during fiscal year.

Operation of the dam and reservoir continued. The reservoir was empty on October 1, 2006. There were no flood damages prevented during FY 2007. There was \$9,000 in sediment damages prevented during FY 2007. Estimated total accumulated flood and sediment damages prevented through FY 2007 are \$214,570,700. There were acre-feet of sediment deposition during FY 2007. The accrued sediment benefits through FY 2007 are \$1,140,200. The refurbishing of the service gates and contract for the replacement of the gate motors were completed in FY 2007.

10. INSPECTION OF COMPLETED FLOOD CONTROL PROJECTS

Included under this heading is inspection of completed flood control projects transferred to local interests for operation and maintenance. Projects in Texas, Colorado, and New Mexico were inspected. Federal costs for FY 2007 were \$811,793.94.

11. SCHEDULING FLOOD CONTROL RESERVOIR OPERATIONS.

Pursuant to Section 7, Flood Control Act of 1944, five projects are operated by others for flood control. These projects are Platoro, Pueblo, Sumner, Navajo, and Brantley Dams.

Platoro Dam on the Conejos River above the town of Platoro, Conejos County, CO, controls runoff from 40 square miles of high mountain area. The authorized purposes are irrigation storage and flood control. The Conejos Water Conservancy District operates Platoro. Total storage is 59,571 acre-feet with the top 6,000 acre-feet solely for flood control. The 53,571 acre-feet is joint-use storage with flood control on a forecast basis during spring runoff. Platoro Dam was authorized by the Interior Appropriation Act of 1941. (See H. Doc. 693, 76th Cong. 3rd Sess.). The Bureau of Reclamation completed construction of this project in 1952.

On October 1, 2006, storage in Platoro Reservoir was 9,901 acre-feet at elevation 9,962.68 feet. Maximum storage of 32,427 acre-feet at elevation 10,002.03 occurred on June 25, 2007. On September

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

30, 2007, storage was 16,022 acre-feet at elevation 9,975.64 feet. There were no flood damages prevented by this project during FY 2007. Total flood damages prevented to date are \$7,213,800.

Pueblo Dam is part of the Fryingpan-Arkansas project that was authorized under Public Law 98-590, 87th Congress, HR 2206 on August 16, 1962. The project was completed in August 1975. Pueblo is operated by the Bureau of Reclamation and is located at river mile 1,293.7 on the Arkansas River in Pueblo County, CO. Pueblo Reservoir has a total capacity of 349,940 acre-feet at the top of the flood pool with 27,000 acre-feet exclusive flood space and 66,000 acre-feet joint use space.

Operation of Pueblo Reservoir began on February 10, 1974. Storage on October 1, 2006 was 11,773 acre-feet, elevation 4,841.98 feet. Maximum storage during the year was 198,865 acre-feet at elevation 4,866.63 on June 30, 2007. Storage on September 30, 2007 was 154,384 acre-feet at elevation 4,854.09 feet. There were no flood damages prevented in FY 2007. Total flood damages prevented to date are \$31,475,300.

Sumner Dam is located on the Pecos River at river mile 710.8 in De Baca County, New Mexico. Sumner Dam was authorized as Alamogordo Dam by the Secretary of the Interior under a Finding of Feasibility approved by the President of the United States on November 6, 1935, under the Federal Reclamation laws. The original project was completed in 1937. Modification work of raising the dam 16 feet, adding a spillway and limiting the service spillway floor to 56,000 cubic-feet-per-second, was completed in 1957. A twenty-four inch bypass line was installed in 1977 to pass flows less than 100 cfs.

The Carlsbad Irrigation District operates Sumner Dam. Storage on October 1, 2006 was 23,238 acre-feet at elevation 4,254.28 feet. Maximum storage for FY 2007 was 39,376 acre-feet at elevation 4,261.57 on February 26, 2007. Storage on September 30, 2007 was 20,168 acre-feet at elevation 4,252.52 feet.

Navajo Dam and Reservoir is located on the San Juan River at river mile 298.6 in San Juan County, New Mexico. Navajo Dam was authorized as part of a Colorado River Storage Project by an act of the 84th Congress, 11 April 1956 (PL 485). The Bureau of Reclamation constructed and is responsible for operation of the project. Construction was initiated in June 1958, and the project was completed and

placed in operation in March 1963. Total capacity at spillway crest is 1,701,300 acre-feet. The project controls a drainage area of 3,230 square miles.

Storage on October 1, 2006 was 1,419,787 acre-feet, elevation 6,065.53 feet. Maximum storage for FY 2007 was 1,628,900 acre-feet, elevation 6,080.27 feet on June 20, 2007. Storage on September 30, 2007 was 1,509,900 acre-feet, elevation 6,072.10 feet.

Brantley Dam, on the Pecos River, above the town of Carlsbad in Eddy County, NM, controls runoff from 13,208 square miles of uncontrolled area. The authorized purposes are irrigation, flood control, fish and wildlife, recreation, and the elimination of the hazards of failure of the McMillan and the Avalon Dams. The total storage is 347,700 acre-feet with 189,700 acre-feet for flood control. Public Law 92-514 authorized Brantley Dam for construction on 20 October 1972, with the cost ceiling raised for the project in October 1980 by Public Law 96-375. On September 6, 1988, the conduits were closed and Brantley Dam started its initial filling. On September 30, 2007 the storage was 29,359 acre-feet at elevation 3,250.59 feet.

12. OTHER AUTHORIZED FLOOD CONTROL PROJECTS

See Table 36-D

13. FLOOD CONTROL WORK UNDER SPECIAL AUTHORIZATIONS

Flood control activities pursuant to Section 205, Public Law 858, 80th Congress, as amended (pre-authorization)

Total Federal costs for Section 205 projects during FY 2007 were \$122,546. Individual costs per project were: Little Puerco River, Gallup, NM \$6,218; Section 205 Coordination Account \$29,426; Oak Creek, Florence, CO \$469; Gila River Grants, Hildago, NM \$9,767; Sun Valley, El Paso, TX \$13,879; Hatch, NM \$54,826; and Vado, Del Cerro, Berino, Mesquite, Dona Ana County, NM \$7,960.

Emergency flood control activities; repair, flood fighting, and rescue work. (Public Law 99, 84th Cong., and antecedent legislation.)

Total Federal costs in FY 2007 were \$558,942. \$437,263 was for disaster preparedness; \$17,201 was

for emergency operation; and \$104,478 for rehabilitation and inspection.

Emergency bank protection (Sec. 14, 1946 Flood Control Act, Public Law 526, 79th Cong.)

Total Federal costs for Section 14 projects for FY 2007 were \$55,311. Individually, the costs were as follows: Section 14 Coordination Account \$31,053; Rio Puerco River, I-40 Bridge, Gallup, NM \$4,124; Powers Blvd., Colorado Springs, CO \$4,694; 27th Street Bridge, Glenwood Springs, CO \$15,440.

Snagging and Clearing for Flood Control (Section 208 of the 1954 Flood Control Act, 83rd Cong.)

There were no costs in FY 2007.

ENVIRONMENTAL INFRASTRUCTURE

14. CENTRAL, NM

Location. Central, NM is defined as Bernalillo, Sandoval, and Valencia counties in central New Mexico.

Proposed project. Section 593 of the Water Resources Development Act of 1999 authorized the Corps of Engineers to provide assistance to non-Federal sponsors in the form of design and construction for water-related environmental infrastructure and resource protection and development of publicly-owned projects, including projects for wastewater treatment and related facilities, water supply, conservation and related facilities, stormwater retention and remediation, environmental restoration, and surface water resource protection and development.

Local cooperation. Local sponsors of the projects are responsible for 25% of the costs associated with each project. The Federal share is 75%.

Condition at the end of the fiscal year. To date, eleven Project Cooperation Agreements (PCA) have been signed. Of those eleven, nine projects have been completed and the remaining projects are in various stages of design and construction. Projects that were completed in FY 2006 are: Rio Rancho Industrial Loop, Belen Utility Infrastructure, Tijeras Phase III, and Coors 8/9/10.

15. NM ENVIRONMENTAL INFRASTRUCTURE

Location. New Mexico Environmental Infrastructure includes the entire state of New Mexico.

Proposed project. Section 595 of the Water Resources Development Act of 1999 as amended authorized the Corps of Engineers to provide assistance to non-Federal sponsors in the form of design and construction for water-related environmental infrastructure and resource protection and development of publicly-owned projects, including projects for wastewater treatment and related facilities, water supply, conservation and related facilities, stormwater retention and remediation, environmental restoration, and surface water resource protection and development. Initial funding was received in FY05.

Local cooperation. Local sponsors of the projects are responsible for 25% of the costs associated with each project. The Federal share is 75%.

Condition at the end of the fiscal year. Eleven Project Cooperation Agreements (PCA) have been executed during FY06. One project was completed, while others were in various stages of design.

16. TRIBAL PARTNERSHIP PROGRAM, NM

Location. Tribal Partnership Program, NM includes all Indian lands within the state of New Mexico, Southwest Texas and Southern Colorado.

Proposed project. Section 203 is a broad mandate wherein the Corps may determine the feasibility of water and other resource development projects that substantially benefit Indian Tribes and are primarily located in Indian country. Such studies may address flood damage reduction, environmental restoration and protection, and the preservation of cultural and natural resources. The Tribes have numerous water, natural and cultural resource challenges, including persistent flooding within their historic and culturally significant ancestral villages, management and operational problems with several aging dams and reservoirs, degradation of significant cultural and environmentally sensitive areas, drought planning and management.

Local cooperation. Feasibility studies are currently cost-shared as 50% Federal and 50% non Federal. An issue remains to be resolved regarding guidance for use of ability to pay provisions for Section 203.

Condition at the end of the fiscal year.

Coordination was initiated with the Navajo Nation and Pueblos of Isleta, Santo Domingo, Santa Clara and Ohkay Owingue regarding project initiation. Coordination continued with the Pueblo of San Ildefonso regarding cost-share agreement and reconnaissance completion for a study under this authority.

17. OTHER WORK UNDER SPECIAL AUTHORITY

Modifications to Structures and Operations of Constructed Corps Projects to Improve the Quality of the Environment, Pursuant to Section 1135 of the 1986 Water Resources Development Act, Public Law 662, 99th Congress, as amended.

Federal cost for Section 1135 was \$333,069 of which \$3,703 was for coordination account funds; \$2,558 for Riparian/Wetland Restoration, Pueblo of Santa Ana, NM; \$61 for Albuquerque Biological Park Wetland Restoration; \$3,011 for Pecos River Restoration, Chaves County; \$48,762 for Aquatic Habitat Restoration at Pueblo of Santa Ana; \$43,160 for Ecosystem Revitalization at Route 66, Albuquerque, NM; \$1,811 for Santa Fe, Pojoaque, Rio Grande, NM and \$230,002 for Las Cruces Dam, Environmental Restoration, NM.

Aquatic Ecosystem Restoration pursuant to Section 206 of the Water Resources Development Act of 1996, Public Law 303, 104th Congress, as amended.

Federal cost for Section 206 was \$681,577 of which \$3,945 was for Coordination Account funds; \$522,229 for Arkansas River Fisheries Habitat

Restoration; \$37,247 for Jemez River Aquatic and Riparian Habitat Restoration; \$113,996 for Bottomless Lakes State Park; \$73 for Janes Wallace Memorial Dam, NM; and \$4,087 for Tamarisk Eradication, CO.

General Investigations

18. SURVEYS

Costs for the fiscal year were \$2,258,700 of which \$120,310 was for flood damage prevention studies, \$821,872 for special studies; \$765,930 for watershed/comprehensive studies; \$48,021 for miscellaneous activities; \$502,567 for coordination with other Federal agencies and non-Federal interests.

19. COLLECTION AND STUDY OF BASIC DATA

Fiscal year costs were \$148,749 for floodplain management and technical services.

Hydrological studies involving collection and study of basic data, such as stream flow data, collection of suspended sediment samples, recording rain gage data, special studies, hydro-meteorological studies, sedimentation studies, and environmental data studies continued. Costs during the fiscal year were \$0.

20. PRECONSTRUCTION ENGINEERING AND DESIGN

Current fiscal year costs were \$172,714 on Southwest Valley Flood Damage Reduction Study, NM for Preconstruction Engineering and Design Costs.

¹ Includes \$200,000 PED funds.

² Includes \$1,186,000 PED funds.

⁴ Includes \$3,492,696 maintenance and improvement costs and \$869,978 for emergency relief, excludes \$2,279,326 cost of initiating project under the authority of Emergency Relief Appropriations Act of 1935, and \$222,669, the cost for work performed with funds transferred to the Corps under Public Works Acceleration Act of 1962.

⁵ Excludes \$59,977 emergency relief funds for new work. Includes \$30,000 for Code 710.

⁷ Includes \$1,187,000 PED funds.

⁸ Includes funds for pre-construction planning of Española Valley unit. Excludes \$1,000,011 appropriated funds transferred to Bureau of Reclamation under memorandum of agreement between that agency and the Corps.

⁹ Includes \$1,658,000 PED funds.

TABLE 36-B AUTHORIZING LEGISLATION

Sec Section In Text	Date Authorizing Act	Project and Work Authorized	Documents
1.	Nov 17, 1986	ACEQUIAS IRRIGATION SYSTEM An irrigation system dating back to the eighteenth century with significant engineering work in the settlement and development of the western portion of the United States. Restoration and of this system has a cultural and historical value to the region. Measures are necessary to restore and protect the river division structures and associated costs.	Public Law 662, 99 th Cong., 2 nd sess. (Sec.1113)
	Oct 12, 1996	Except that the Federal share of reconnaissance studies carried out by the Secretary under this section shall be 100%.	Public Law 104-30 104 th Cong., (Sec. 101)
4.	Oct 27, 1965	EL PASO, TEXAS A single-purpose flood control system of detention dams, diversion dikes and channels to collect, regulate, and discharge arroyo runoff in the Rio Grande. Consists of four independent units (NW Area, Central Area, and two units, Copper system and Bluff Channel of the SE Area).	H. Doc. 207, 89 th Cong. 1 st sess. ¹
6.	Jun 30, 1948	RIO GRANDE BASIN, NEW MEXICO Authorized to be appropriated \$3,500,000 to be expended by the Dept. of the Army for partial accomplishment of approved general comprehensive plan for the Rio Grande Basin in NM and Colorado.	H. Doc. 243, 81 st Cong., 1 st sess.
	May 17, 1950	Authorized to be appropriated and additional \$39,000,000 for Department of the Army for prosecution of comprehensive for the Rio Grande Basin.	Public Law 516, 81 st Cong., 2 nd Sess.
	Jul 14, 1960	Authorized Cochiti Dam on Rio Grande and Galisteo Dam on Galisteo Creek as additions to authorized comprehensive plan for Rio Grande Basin (Cochiti Dam was authorized in lieu of Low Chamita Dam of Chamita Dam Reservoir Project on Rio Chama under "substitute plan"). Also authorized to be appropriated an additional \$58,300,000 for Dept. of the Army for an addition to comprehensive plan for the Rio Grande Basin.	S. Doc. 94, 86 th Cong.
	Nov 17, 1986	Authorized legislation of the Abiquiu Dam Emergency Gates by the Water Resources Development Act of 1986 (PL 99-662).	Public Law 662, 99 th Cong., 2 nd sess.
	Sep 30, 1997	The emergency gate construction project for Abiquiu Dam, NM, Authorized by Section 1112 of the Water Resources Development Act of 1986 (PL 99-662, 100 Stat. 4232) is modified to authorize the Secretary of the Army, acting through the Chief of Engineers, to Construct the project at an estimated cost of \$7,000,000. The non-Federal share of the project shall be 25 percent of those costs of the project attributable to an increase in flood protection as a result of the installation of such gates.	
6B.	Nov 20, 2004	ALBUQUERQUE LEVEES, NM The Secretary of the Army, acting through the Chief of Engineers, is authorized to undertake, at full federal expense, a detailed evaluation of the Albuquerque levees for purposes of determining structural integrity, impacts of vegetative growth, and performance under current hydrological conditions.	Public Law 108-447 108 th Cong (Title I)

TABLE 36-B

AUTHORIZING LEGISLATION

6F.	Nov 17, 1986	MIDDLE RIO GRANDE FLOOD PROTECTION, BERNALILLO TO BELEN, NM Authorized project for flood control, Middle Rio Grande Flood Protection, Bernalillo to Belen, NM. Authorized increase of flood protection through the dredging of the bed of the Rio Grande in the vicinity of Albuquerque, NM, to an elevation lower than existed on the date of enactment of this Act. The project shall include the establishment of 75 acres of wetlands for fish and wildlife habitat and the acquisition of 200 acres of land for mitigation of fish and wildlife losses.	Public Law 662, 99 th Cong., 2 nd sess.
6G.	Nov 07, 2003	RIO GRANDE BOSQUE REHABILITATION, (BOSQUE WILDFIRES), NM The Secretary of the Army, acting through the Chief of Engineers, is authorized to undertake appropriate planning, design, and construction measures for wildfire prevention and restoration in the Middle Rio Grande bosque in and around the City of Albuquerque. Work shall be directed toward those portions of the bosque which have been damaged by wildfire or are in imminent danger of damage from wildfire due to heavy fuel loads and impediments to emergency vehicle access.	Public Law 108-137 108 th Cong
6H.	Jun 30, 1948 and May 17, 1950	RIO GRANDE FLOODWAY, NM Channel rectification, levee enlargement and construction, and bank stabilization on Rio Grande between river mile 123 and 394 (San Acacia to Bosque del Apache Unit).	Con., 1 st Sess. ¹ and Public Law 516, 81 st Cong., 2 nd sess.
6I.	Oct 31, 1992	RIO GRANDE FLOODWAY, SAN ACACIA TO BOSQUE DEL APACHE UNIT, NM Modified the cost sharing to more equitably reflect the non-Federal contribution for the project by that percentage of benefits which is attributable to the Federal properties; except that, for purposes of this subsection, Federal property benefits may not exceed 50 percent of the total project benefits.	Public Law 102-580 102d Cong., (Sec. 102(e)).
14.	Aug 17, 1999	CENTRAL, NM For the counties of Bernalillo, Sandoval and Valencia, New Mexico design and construction assistance for water-related environmental infrastructure and resource protection and development projects to include wastewater treatment and related facilities, water supply, conservation and related facilities, stormwater retention and remediation, environmental restoration, and surface water resource protection and development. Federal costs under each local cooperation agreement shall be 75 percent in the form of grants or reimbursements. The non-Federal share of operation and maintenance costs shall be 100 percent. Authorized appropriation is \$25,000,000 available in FY 2000 and remain available until expended.	Public Law 106-53, 106 th Cong., (Sec. 593)
15.	Aug 17, 1999 and Nov 07, 2003	NM ENVIRONMENTAL INFRASTRUCTURE For the state of New Mexico, design and construction assistance for water-related environmental infrastructure and resource protection and development projects, including projects for wastewater treatment and related facilities; water supply and related facilities; environmental restoration; and surface water resource protection and development. The Federal share of project costs under each local cooperation agreement shall be 75 percent and may be in the form of grants or reimbursements. The non-Federal share of operation and maintenance costs shall be 100 percent. Authorized appropriation is \$25,000,000 available in FY 2004 and to remain available until expended.	Public Law 108-137, 108 th Cong (Sec 117) and Public Law 106-53 106 th Cong (Sec 595)
16.	Dec 11, 2000	TRIBAL PARTNERSHIP PROGRAM In cooperation with Indian tribes and the heads of other Federal agencies, the Secretary may study and determine the feasibility of carrying out water resources development projects that will substantially benefit Indian tribes and are located primarily within Indian country. Studies may address projects for flood damage reduction, environmental restoration and protection, and preservation of cultural and natural resources; and such other projects as the Secretary, in cooperation with Indian tribes and the heads of other Federal agencies, determines to be appropriate.	Public Law 106-541 106 th Cong (Title II)

¹ River mile 0 is at intersection of New Mexico-Texas state line with international boundary at El Paso, Texas.

² Does not include non-Federal costs.

³ Includes \$5,383,000 major rehabilitation, \$138,900 for recreation facilities, and \$3,600,000 for emergency gates.

LITTLE ROCK, ARKANSAS

The civil works portion of this District covers an area of approximately 36,414 square miles in northern, western, and southwestern Arkansas and a portion of Missouri. This area is within the Arkansas River, Little River, and White River basins. In the Arkansas River Basin, the District is responsible for planning, design, construction, operation, and maintenance of the navigation portion of the McClellan-Kerr Arkansas River Navigation System (MKARNS). The District is also responsible for the areas included in the Arkansas River drainage basin from above Pine Bluff, AR, to below the mouth of the Poteau River, near Fort Smith, AR. In Little River Basin, the

District is responsible for the portion of the Little River and its tributaries that are in the state of Arkansas above its mouth near Fulton, AR. In the White River Basin, the District is responsible for those portions in southern Missouri and northern and eastern Arkansas in the White River drainage basin and its tributaries above Peach Orchard Bluff, AR. The Memphis District is responsible for navigation maintenance on the White River below Newport, AR, to the mouth of Wild Goose Bayou, in Arkansas County, AR. The White River downstream from the mouth of Wild Goose Bayou is part of MKARNS.

NAVIGATION

1. Arkansas River Basin, AR, OK, AND KS

Location. The headwaters for the Arkansas River are in the Rocky Mountains near Leadville, CO. The river flows southeastward 1,396 miles through Colorado, Kansas, Oklahoma, and Arkansas to join the Mississippi River 599 miles above Head of Passes, LA.

Previous projects. For details see page 1066, Annual Report for 1932, and pages 744, 864, and 881, Annual Report for 1943.

Existing project. The MKARNS provides navigation, hydroelectric power, flood control, water supply, sediment control, recreation, and fish and wildlife propagation improvements in the Arkansas River Basin. The MKARNS provides a navigation channel 9 feet deep and 444.8 miles long. The channel begins at the mouth of the White River, which enters the Mississippi River 599 miles above Head of Passes, LA, thence 9.8 miles upstream to the mouth of Wild Goose Bayou; thence 9.2 miles by a land cut, designated as Arkansas Post Canal to mile 42 (1943 survey) on the Arkansas River; thence 376.0 miles to the mouth of the Verdigris River at navigation mile 395.0; thence 49.8 miles up the Verdigris River to the head of navigation at Catoosa, OK. A 12 foot channel depth was authorized by Section 136 of PL 108-137 in 2004. Construction of the 12 foot channel depth began in 2006.

The waterway is canalized throughout its length by 18 locks and dams with a total lift of 420 feet. Dardanelle, Ozark-Jeta Taylor, Robert S. Kerr, and Webbers Falls are multiple purpose projects that include hydro-power. Lock chambers are 110 by 600 feet. A minimum channel width of 150 feet is provided for the Verdigris River, 225 feet for San Bois Creek, 250 feet for the Arkansas River, and 300 feet for Arkansas Post Canal and White River Entrance Channel.

Other coordinated developments consist of 15 lakes, of which 13 are in Tulsa District, in the states of Kansas and Oklahoma, and two are in the Little Rock District. Pertinent data and estimated Federal cost are summarized in Tables 37-H and 37-I, Navigation: Arkansas River Basin, AR, OK, and KS.

Local cooperation. For MKARNS, local interests must provide adequate terminal and transfer facilities and bear the increased costs of maintenance and operation of all altered rail and highway routes, including bridges and appurtenances, utilities, and other existing improvements, other than federally owned. For lakes see requirements for each individual lake.

Terminal facilities. Public port facilities are in operation at Pine Bluff (Jefferson County), Little Rock, and Fort Smith, AR, and Muskogee and Catoosa (Tulsa-Rogers County), OK. Port authorities have been organized to develop public facilities at North Little Rock, Dardanelle-Russellville, Morrilton, Clarksville, Ozark, and Van Buren, AR, and Sallisaw, OK. Terminal facilities are in operation or being built at 35 locations in Arkansas and at 25 locations in Oklahoma along the improved waterways.

Operations and results during fiscal year.

Flood damages prevented by Little Rock District levee projects in the Arkansas River Basin during FY07 are estimated at \$218,580,500; flood losses prevented through FY07 are estimated at \$1,058,050,200.

Approximately 12.4 million tons of commerce was moved on the Arkansas portion of the MKARNS during calendar year 2007. Details of the MKARNS and lakes in Arkansas are shown on the following pages.

FY'06 withdrawals for water supply purposes were 92.22 acre-feet from Nimrod Lake.

In FY07, the construction was completed to Rehab the Tow Haulage Winches at Hardin Lock & Dam (No 3), Emmett Sanders Lock & Dam (No 4), Lock & Dam No 5 and David D. Terry Lock & Dam (No 6).

Annual dredging contract was awarded. Due to the flooding events in the summer months, Tulsa District developed serious shoaling. The contract was awarded ahead of schedule and the dredge was sent to Tulsa District for emergency relief. Little Rock District also experienced shoaling, but was handled through temporary measures (clamming with in-house labor and pool deviations). The contract has one base year and one option year.

The annual Bank Stabilization contract was not awarded in FY07. During the first attempt, there was one bidder, which exceeded IGE more than 25%; could not award. Converted that solicitation to a RFP; could not negotiate. During the second attempt, the solicitation was advertised as unrestricted; one bidder; could not award because that bidder exceeded the IGE by more than 25%. Solicited a third time and converted to RFP. At the end of FY07, the Corps was in negotiations with the lone bidder. Expect an early FY08 award.

Continued work on the manufacture of the Motor Control Center Panels at Murray Lock & Dam (No 7), Toad Suck Ferry Lock & Dam (No 8), Arthur V. Ormond Lock & Dam (No 9) and James W. Trimble Lock & Dam (No 13). Most of the efforts were concentrated on Ormond Lock & Dam (No 9) since that's the first location to be installed.

Condition at end of fiscal year. (See Tables 37-H and 37-I, *Navigation: Arkansas River Basin; AR, OK, and KS, for status for individual items, navigation projects, lakes, and basin plan.*) Work continues on the Arkansas River project in this District including a meander cutoff levee between the Arkansas and White Rivers.

Tow haulage installation has been completed on the Arkansas portion with the exception of Montgomery Point. Installation of tow haulage equipment was completed at David D. Terry Lock and Dam (No. 6), Lock and Dam No. 5, Emmett Sanders Lock and Dam (No. 4), and Joe Hardin Lock and Dam (No. 3) in 1994, at Norrell Lock (Lock 1) and Lock No. 2 in 1997, and Murray Lock (No. 7) in 1999. Tow haulage was installed on Toad Suck Lock and Dam (No. 8), Ormond Lock and Dam (No. 9), Dardanelle Lock and Dam (No. 10), Ozark – Jeta Taylor Lock and Dam (No. 11), and Trimble Lock and Dam (No. 13), in FY 99-FY00.

2. Arthur V. Ormond Lock & Dam (No.9), AR

Location, existing project, local cooperation, and terminal facilities. (See section 1.)

Operations and results during fiscal year. Continued operation and maintenance. Rockefeller Lake (pool 9) has four developed parks that in FY07 experienced public visitation exceeding 800,000 visitor-hours.

Condition at end of fiscal year. Construction began in April 1965 and the lock and dam was placed in operation in July 1969. Construction of Holla Bend closure structure (fish and wildlife mitigation) began in July 1986 and was completed in September 1987. Construction of a non-Federal hydropower project, under the authority provided by the Federal Energy Regulatory Commission, was completed and placed into operation in August 1993. Construction of a widened downstream entrance was completed in 1998. Installation of tow haulage equipment was complete in 1999.

3. David D. Terry Lock And Dam (No. 6), AR

Location, existing project, local cooperation, and terminal facilities. (See section 1.)

Condition at end of fiscal year. Construction began in January 1965 and the lock and dam project was placed in operation in August 1968. Tow haulage equipment was added in June 1994. Currently, the project has one developed park, which in FY07 experienced public visitation exceeding 3.2 million visitor-hours.

4. Emmett Sanders Lock And Dam (No. 4), AR

Location, existing project, local cooperation and terminal facilities. (See section 1.)

Operations and results during fiscal year. Continued operation and maintenance. Pool 4 has two developed parks, which in FY07 experienced public visitation exceeding 665,000 visitor-hours.

Condition at end of fiscal year. Construction began in May 1964 and the lock and dam project was placed in operation in December 1968. Construction of a 40-foot wide, 9,600-foot long highway bridge crossing the lock and dam was completed in July 1995. The Corps of Engineers, as the Federal agency, has jurisdiction and custody of the dam (23 U.S.C. 320 [Public Law 2810]). The project was 100 percent funded by the Arkansas State Highway and Transportation Department. Tow haulage equipment was placed into operation in June 1994.

5. James W. Trimble Lock And Dam (No. 13), AR

Location, existing project, local cooperation, and terminal facilities. (See section 1.)

Operations and results during fiscal year. Continued operation and maintenance. In FY07, the project's three developed parks experienced public visitation exceeding 740,000 visitor-hours.

Condition at end of fiscal year. Construction began in October 1965 and the lock and dam were placed in operation in April 1969. The bridge across the dam was completed in July 1968. Construction of a non-Federal hydropower facility at the project was completed in November 1988 under the authority provided by the Federal Energy Regulatory Commission. Tow haulage was placed into operation in 2000.

6. Lock No. 2 And Wilbur D. Mills (No. 2), AR

Location, existing project, local cooperation, and terminal facilities. (See section 1.)

Operations and results during fiscal year. Operation and maintenance continued. Wilbur D. Mills has four developed parks, which in FY07 experienced public visitation exceeding 3.1 million visitor-hours.

Condition at end of fiscal year. Construction began in May 1963. The lock was placed in operation in March 1968. Emergency repairs to the scour protection features and tainter gates at the dam that resulted from a barge accident in December 1982 were completed in FY85. The barges that clogged the dam gates during the December 1982 flood showed that, with a certain set of circumstances (higher than normal head combined with the clogged gates resulted in high current velocity that caused both upstream and downstream scouring), the structure could fail. This condition exists primarily be-

LITTLE ROCK, AR DISTRICT

cause the structure was constructed on piling and designed for all of the gates to operate in unison.

A model study by the Waterways Experiment Station determined the most feasible solution to this problem is to extend the stilling basin downstream. A contract to extend the stilling basin was awarded in June 1990 and completed in FY94. Project costs are estimated at \$21.6 million. Tow haulage was placed into operation in 1997. Construction of a non-Federal hydropower project, under the authority provided by the Federal Energy Regulatory Commission is complete and was placed into operation in December 1999.

7. Joe Hardin Lock And Dam (No.3), AR

Location, existing project, local cooperation, and terminal facilities. (*See section 1.*)

Operations and results during fiscal year. Continued operation and maintenance. Pool 3 has one developed park which in FY07 experienced public visitation exceeding 297,000 visitor-hours.

Condition at end of fiscal year. Construction began in May 1963 and the lock and dam were placed in operation in December 1968. Tow haulage equipment was installed and operational in 1994.

8. Lock And Dam No. 5, AR

Location, existing project, local cooperation and terminal facilities. (*See section 1.*)

Operation and results during fiscal year. Continued operation and maintenance. Pool 5 has two developed parks which in FY07 experienced public visitation exceeding 928,000 visitor-hours.

In FY07, the work was complete to Rehab and Paint the Tainter Gates, which was awarded in FY05. The contractor was called back to the site to repair and paint some deficient areas. That work was also complete. At the end of the FY, the Contractor had submitted a Request for Equitable Adjustment, which is currently being reviewed by Construction Branch.

Condition at end of fiscal year Construction began in November 1964 and the lock and dam were placed in operation in December 1968. Tow haulage equipment was installed in June 1994.

9. Montgomery Point Lock And Dam, AR

Location, existing project, local cooperation, and terminal facilities. (*See section 1.*)

Operations and results during fiscal year. Operation and maintenance continued.

Condition at end of fiscal year . Construction began in August 1997 and the lock and dam were placed in operation in February of 2005. Tow haulage equipment and docking facilities have not been completed.

10. Murray Lock And Dam (No. 7), AR

Location, existing project, local cooperation, and terminal facilities. (*See section 1.*)

Operations and results during fiscal year. Operation and maintenance continued. Murray has five developed parks, which in FY07 experienced public visitation exceeding 3.8 million visitor-hours. .

Condition at end of fiscal year. Construction began in November 1964 and the lock and dam was placed in operation in October 1969. Construction of a non-Federal hydropower facility at the project was completed in May 1988 under the authority provided by the Federal Energy Regulatory Commission. Tow Haulage was completed and operational October 1999. The Pedestrian bicycle bridge project was completed in September of 2006. It is the longest bridge in the nation construction specifically for pedestrians and bicycles, not cars.

11. Norrell Lock And Dam (No. 1) And Entrance Channel, AR

Location, existing project, local cooperation, and terminal facilities. (*See section 1.*)

Operations and results during fiscal year. Operation and maintenance continued. The project currently has one developed park which in FY07 experienced public visitation exceeding 52,000 visitor-hours.

Condition at end of fiscal year. Construction began in May 1963, and the lock and dam were placed in operation in June 1967. A contract to add tow haulage equipment to the lock was completed in 1997.

12. Toad Suck Ferry Lock And Dam (No. 8), AR

Location, existing project, local cooperation, and terminal facilities. (*See section 1.*)

Operations and results during fiscal year. Continued operation and maintenance. In FY07, the project's five developed parks experienced public visitation exceeding 1.1 million visitor-hours.

Condition at end of fiscal year. Construction began in July 1965 and the lock and dam was placed in operation in November 1969. The Conway water supply project was completed and transferred to the city for operation and maintenance in July 1983. Installation of tow haulage equipment was complete in 1999.

13. Maintenance And Repair Fleet And Marine Terminals, AR

Location, existing project, local cooperation, and terminal facilities. (See section 1.)

Operations and results during fiscal year. Operation and maintenance continued.

Condition at end of fiscal year. Construction of Pine Bluff Marine Terminal began March 1968 and was placed in operation in April 1969. Construction of the Dardanelle Marine Terminal began June 1968 and it was placed in operation in November 1969.

14. Other Authorized Navigation Projects

(See Table 37-C for other authorized navigation projects.)

15. Navigation Work Under Special Authorization

Preauthorization studies under the small project continuing authorities program, navigation activities, Section 107, Public Law 86-645, as amended. Expenditures for Sec. 107 activities in FY06 totaled \$128,654. Coordination account, \$7,949; Russellville Harbor, Arkansas River, AR; \$120,705.

FLOOD CONTROL

16. Blue Mountain Lake, AR

Location. (See Table 37-1: Arkansas River Basin, AR, OK, and KS: Lakes.)

Existing project. Construction cost was approximately \$5.1 million. For further information see pages 906 and 907 of the 1962 Annual Report.

Local cooperation. Section 2, Flood Control Act of 1938 applies.

Operations and results during fiscal year. Operation and maintenance of project continued. Flood damages prevented during FY07 are estimated at \$681,300; cumulative benefits through September 30, 2007, are estimated at \$33,740,300. The project's five developed parks experienced public visitation exceeding 1.5 million visitor-hours during FY07.

Condition at end of fiscal year. Project is complete except for additional recreational sanitary facilities. Construction of the project began in May 1940 and it was placed in operation in March 1947.

17. Clearwater Lake, MO

Location. (See Table 37-K: White River Basin, AR & MO: Lakes.)

Existing project. Construction of the outlet works for the dam was initiated in May 1940 and completed in March 1942. Due to work stoppage during World War II, the earth embankment and uncontrolled spillway were not completed until December 1948. The spillway weir was completed in 1951. Cost of construction was approximately \$9,715,000. For further information, see pages 897 and 898 of 1962 Annual Report.

Major rehabilitation. Construction of an upstream seepage berm, a grout curtain on the right abutments, a parapet wall along the dam, and widening of the spillway from 190 feet to 370 feet was completed in December 1988 at a cost of approximately \$11,620,000. A major rehabilitation Dam Safety Project for Seepage control was initiated in FY 06. Phase I of the major rehabilitation project was initiated in FY06 and work is ongoing. Phase II of the major rehabilitation project is expected to be awarded near the end of FY 08.

Local cooperation. Section 2, Flood Control Act of 1938 applies.

Operations and results during fiscal year. Operation and maintenance continued. Flood damages prevented during FY07 are estimated at \$10,854,900; cumulative benefits through September 2007 are estimated at \$228,529,300. Project currently has 6 developed parks, which in FY07 experienced public visitation exceeding 6.5 million visitor-hours.

Condition at end of fiscal year. Project is complete except for improvements to the sanitary facilities in the recreation areas. Construction of the project began in June 1940 and was ready for beneficial use in March 1948. A new water control plan is being considered that better meets the needs of the interests in the basin. In January 2003, a sinkhole developed in the upstream face of the dam. Investigations were conducted that indicate seepage through the bedrock is the likely causative mechanism for the sinkhole. A drilling and grouting project was awarded in the approximate amount of \$2.1M. A major rehabilitation study was initiated in FY03 to develop a long-term solution for seepage, which lead to a new construction start in FY06.

18. DeQueen Lake, AR

Location. On Rolling Fork River, RM 22.8, a tributary of the Little River, in Sevier County, about 4 miles northwest of DeQueen, AR.

Existing project. An earth-fill dam, 2,360 feet long, constructed to 160 feet above streambed. An uncontrolled spillway, 200 feet wide, is about 1,400 feet east

LITTLE ROCK, AR DISTRICT

of main embankment. Outlet works consist of a gated conduit, 12 feet in diameter.

The lake controls 169 square miles of drainage area and provides a total storage of 136,100 acre-feet (101,200 acre-feet for flood control storage, 25,500 acre-feet for conservation storage, and 9,400 acre-feet for sedimentation reserve). Federal cost of the project is estimated at \$19,623,752.

Local cooperation. Section 2, Flood Control Act of 1938, and Section 301, Water Supply Act of 1958, as amended, apply.

Operations and results during fiscal year. Routine operation and maintenance continued. Flood damages prevented during FY07 are estimated at \$749,400; cumulative benefits through September 2007 are estimated at \$12,298,700. In FY07, the project's six developed parks experienced public visitation exceeding 1.3 million visitor-hours.

Condition at end of fiscal year. Construction began April 1966. Project was placed in useful operation in August 1977.

19. Dierks Lake, AR

Location. On Saline River, RM 56.6, a tributary of the Little River, about 5 miles northwest of Dierks, Howard County, AR.

Existing project. An earth-fill dam, 2,760 feet long, and about 153 feet above the streambed. An uncontrolled spillway 800 feet wide is in a saddle at the west end of the dam. Outlet works consisting of a gated 6- by 9-foot oblong conduit, one 24 -inch low-flow pipe, and one 30-inch water supply pipe are provided. The lake controls a drainage area of 114 square miles and provides for storage of 67,100 acre-feet for flood control and 29,700 acre-feet for water supply, conservation, and sedimentation reserve, a total of 96,800 acre-feet. The Federal cost of the project was \$16,002,903.

Local cooperation. Section 2, Flood Control Act of 1938, and Water Supply Act of 1958, as amended, apply.

Operations and results during fiscal year. Continued operation and maintenance. Flood damages prevented during FY07 are estimated at \$353,800; cumulative benefits through September 2007 are estimated at \$7,456,700. In FY07, the project's three developed parks experienced 1.1 million visitor-hours.

Condition at end of fiscal year. Construction began in June 1968. The embankment closure was completed in May 1975, and the project was placed in useful operation.

20. Fourche Bayou Basin, Little Rock, AR

Location: On Fourche, Rock and Grassy Flat Creeks, Little Rock, AR. Fourche Creek enters the Arkansas River at mile 113.5.

Existing Project: This flood control project, consisting of 11.6 miles of channel improvement with railroad and road bridge widening (cost of \$30.7 million, non-Federal share \$9.6 million), had its operation and maintenance manual provided to the city of Little Rock in April 1998. The project authorization includes the acquisition of 1,750 acres of bottomlands (for flood storage and environmental preservation) with nature appreciation facilities; this work is remaining.

Local Cooperation: The city of Little Rock, the project sponsor, signed the local cooperation agreement in Aug 1987 according to the requirements of WRDA 1986. A new agreement is required for the remaining work. The estimated total project cost is \$36,612,000 with a Federal share of \$24,951,000 and a non-Federal share of \$11,661,000. Federal funds in the amount of \$3,536,000 would need to be appropriated to complete the project.

Operations During Current Year: CESWD is in the process of approving the Limited Reevaluation Report for ASA (CW) to determine whether to budget for the remaining work - acquisition of the bottomlands. In FY 2007, \$0 of CG funds were expended.

21. Gillham Lake, AR

Location. Dam site is on the Cossatot River, RM 49.0, in Howard County, about 5 miles northeast of Gillham in Sevier County, AR.

Existing project. Federal cost of the project was \$17,827,111.

Local cooperation. Section 2, Flood Control Act of 1938, and Section 301, Water Supply Act of 1958, as amended, apply. Tri-Lakes Water District furnished a resolution of intent to repay costs allocated to water supply storage.

Operations and results during fiscal year. Continued operation and maintenance. Flood damages prevented during FY07 are estimated at \$1,046,200; total cumulative flood damages prevented are estimated at \$17,681,300. In FY07, the project's four developed parks experienced public visitation exceeding 1 million visitor-hours.

Condition at end of fiscal year. Construction began in June 1968. The embankment closure was completed

in May 1975, and the project was placed in useful operation.

22. Little River Basin, AR

Location. Improvements are on the Little River and tributaries in Arkansas. More definite locations of individual items are shown in Table 37-J.

Existing project. A six-lake system for flood control and other purposes in the Little River Basin. The system consists of four lakes in Arkansas: Millwood on the main stem, Dierks on the Saline River, DeQueen on the Rolling Fork River, and Gillham on the Cossatot River; and two lakes in Oklahoma: Broken Bow on the Mountain Fork River and Pine Creek on the Little River. Under a District boundary change, effective in October 1980, the four projects in this system in Arkansas were reassigned from the Tulsa District to the Little Rock District.

Local cooperation. Section 2, Flood Control Act of 1938, and Section 301, Water Supply Act of 1958, as amended, apply. Tri-Lakes Water District (DeQueen, Gillham, and Dierks) furnished a resolution of intent to repay costs allocated to water supply storage. The Southwest Arkansas Water District is currently repaying costs allocated to water supply storage at Millwood Lake.

Operations and results during fiscal year. Operation and maintenance of projects continued. See individual projects for details. Flood damages prevented by the Little River Basin reservoirs during FY07 are estimated at \$5,092,000; cumulative benefits through September 2007, are estimated at \$54,149,500.

Withdrawals for water supply purposes were approximately: Tri-Lakes Water District, AR, 1,221.48 acre-feet from Gillham Lake; Tri-Lakes Water District, AR, 305.77 acre-feet from Dierks Lake; Tri-Lakes Water District, AR, 451.83 acre-feet from DeQueen Lake, and Southwest Arkansas Water District, AR, 74,813.82 acre-feet from Millwood Lake.

Condition at end of fiscal year. Millwood, DeQueen, Gillham, and Dierks Lakes are complete and in operation.

23. Millwood Lake, AR

Location. On the Little River, RM 16.0, approximately 7 miles east of Ashdown, Little River County, AR, and about 2 miles northeast of Millwood, Little River County, AR.

Existing project. The Federal cost of the project was \$46,087,382.

Local cooperation. Section 2, Flood Control Act of 1938 applies.

Operations and results during fiscal year. Routine operation and maintenance continued. Flood damages prevented during FY07 are estimated at \$2,942,600; cumulative benefits through September 2007 are estimated at \$16,712,800. Millwood Lake has 12 developed parks, which in FY07 experienced public visitation exceeding 2.4 million visitor-hours.

The design of Stabilize V-Ditch was started in FY07. Due to lack of funds for the construction, design was suspended at the 30% phase and placed on the shelf until additional funds were available. The funds for construction were required for the emergency electrical repair to the Millwood Project Office, which was damaged during a storm.

Condition at end of fiscal year. Construction began in September 1961 and the project was placed in full flood control operation in August 1966.

24. Nimrod Lake, AR

Existing project. Estimated cost is \$4,092,825. For further information see pages 908 and 909 of 1962 Annual Report.

Local cooperation. Section 2 of the 1938 Flood Control Act applies.

Operations and results during fiscal year. Operation and maintenance of project continued. Addition and improvement to existing recreation sanitary facilities continued. During FY07, flood damages prevented are estimated at \$648,200; cumulative benefits through September 2007 are estimated at \$25,707,400. In FY07, seven parks experienced public visitation exceeding 1.8 million visitor-hours. In FY07, a contract was awarded for the Campsite Turnout Maintenance at Quarry Cove Park, Carter Cove Park, Sunlight Bay Park, River Road Park, County Line Park and Project Point Park.

Condition at end of fiscal year. Project is complete.

25. White River Basin (Little Rock District), AR & MO

Location. Improvements are on the White River and tributaries, Arkansas and Missouri. More definite location of individual items is shown in Table 37-K: White River Basin.

Existing project. A general comprehensive plan for flood control and other purposes in the White River Basin. The plan includes seven lakes; two are flood control only projects and five are multiple-purpose projects.

LITTLE ROCK, AR DISTRICT

Beaver, Table Rock, Bull Shoals, Norfolk, Clearwater, Greers Ferry and Bell Foley lakes were selected and approved for construction by the Chief of Engineers, and individual reports on six of these seven lakes are presented on subsequent pages. The Bell Foley project, the remaining unbuilt authorized project, was reevaluated in FY 89; the project continues to have a favorable benefit-to-cost ratio since its formulation in 1968. .

Local cooperation. Section 2, Flood Control Act of 1938 applies, Water Supply Act of 1958, as amended, applies to Beaver, Greers Ferry, and Norfolk projects.

Operations and results during fiscal year. Operation and maintenance of projects continued. Flood damages prevented by the White River Basin reservoirs during FY07 are estimated at \$20,217,300; cumulative benefits through September 2007, are estimated at \$697,721,300. Flood damages prevented by the White River Basin levees during FY07 are estimated at \$3,628,700; cumulative benefits through September 2007, are estimated at \$108,389,200.

Electric energy delivered to Southwestern Power Administration for marketing during FY06 totaled 475,354.4 MWh.

FY06 water releases for fish hatcheries were: 28,959 acre-feet from Norfolk Lake for U.S. Fish and Wildlife Service trout hatchery; 14,479 acre-feet from Table Rock Lake for Missouri Department of Conservation trout hatchery; and, 14,479 acre-feet from Greers Ferry Lake for U.S. Fish and Wildlife Service trout hatchery.

FY'06 withdrawals for water supply purposes were: Beaver Water District, AR, 47,432.58 acre-feet, and Carroll-Boone Water District, AR, 8,289.18 acre-feet, from Beaver Lake; Madison County Water District, AR, 3,721.58 acre-feet, and Benton-Washington Counties Water District, AR, 7,721.11 ac-ft, from Beaver Lake; Kings River Country Club, 00 ac-ft, from Table Rock Lake; Marion County Regional Water District, AR, 985.53 acre-feet from Bull Shoals Lake; Water and Sewer Improvement District No.3 of Mountain Home, AR, 3,807.77 acre-feet from Norfolk Lake; and the city of Clinton, AR, 2,703.38 acre-feet; Higden., AR, 4,609.62 acre-feet; Red Apple Inn, AR, 151.43 acre-ft; Thunderbird Country Club, AR, 26.65 acre-ft, and, Tannenbaum, AR, 134.29 acre-ft from Greers Ferry Lake.

Condition at end of fiscal year. Beaver, Table Rock, Bull Shoals, Norfolk, Clearwater, and Greers Ferry lakes are complete and in operation. Progress on these lakes is shown in individual reports. Water Valley and Lone Rock lakes have been deauthorized. A new water control plan was approved and implemented in December 1998. This plan was developed in close co-

ordination with the basins various interests and was recommended as their preferred plan of operation.

26. Inspection Of Completed Flood Control Projects

Approved regulations for operation and maintenance of flood control works, Part 208 of Title 33, Code of Federal Regulations, provide for periodic inspection of completed projects transferred to local interests for operation and maintenance. Inspections of local flood protection projects were made to determine extent of compliance with approved regulations for maintenance and operation of these projects. Responsible officials of improvement districts concerned were advised of inadequacies in maintenance and operation of local flood protection works under their jurisdiction where appropriate.

27. Other Authorized Flood Control Projects

(See Table 37-E: Other Authorized Flood Control Projects.)

Multiple-Purpose Projects Including Power

28. Beaver Lake, AR

Location. (See Table 37-K: White River Basin.)

Existing project. Estimated cost is \$50,797,000. For further information see 788 and 789 of 1966 Annual Report. (For authorization see Table 37-B)

Major rehabilitation. Since the dam was constructed there has been a seepage problem below Dike No. 1. Based on detailed investigation, it was determined that the limestone foundation under Dike 1 and 200 feet of the north end of the main dam embankment is the main problem. The plan of improvement was a concrete seepage cutoff in Dike 1 and the north end of the main dam. A \$16.9-million contract to construct a concrete cutoff wall was awarded in June 1989; the notice to proceed was issued in October 1989. The contract period was estimated to be 760 days. However, the contractor ceased productive work due to inability to excavate rock and was placed in default. An \$18.8 procurement contract was awarded in April 1992. Work began in May 1992 and all work was completed in Nov 1995.

The Beaver Dam Safety Assurance study was completed with FY 97 expenditures of \$1,359.61.

Water Quality Enhancement. Congress directed the Corps to implement best management practices (BMP's) in the Beaver Lake watershed and monitor the effects of these practices on water quality. A study was completed and a project report was approved in July 1989. The BMP's and water quality monitoring were concurrently implemented over a 5-year period, which

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

began in May 1991 with a project completion date of July 1997.

The BMP's were implemented under the terms of a memorandum of agreement between the Corps and the Natural Resources Conservation Service (NRCS), formerly the Soil Conservation Service, with the assistance of the Agricultural Stabilization and Conservation Service. The water quality monitoring was implemented under terms of a local cost-sharing agreement with the Arkansas Soil and Water Conservation Commission. Water quality monitoring was performed in consultation with the Environmental Protection Agency by a Corps administered contract. The water quality-monitoring contract was awarded on January 29, 1992. Water quality sampling began in May 1992 and was completed on July 1, 1996. BMP implementation was completed August 31, 1995. Cost in FY98 was \$67,897.93 Federal, and \$1,434.58 non-Federal. Total project cost was \$6,878,775.15

Environmental Infrastructure Assistance. The Water Resources Development Act of 1992 authorized the Corps of Engineers to provide design and construction assistance to appropriate non-Federal interests for a water transmission line from the northern part of Beaver Lake, Arkansas, into Benton and Washington Counties. This project is part of a \$40 million project, which includes a water intake, treatment and storage facilities, and transmission lines. The Little Rock District and the project sponsor, Benton/Washington County Water Association, executed a Memorandum of Agreement in June 1997. The Little Rock District then transferred \$3 million to the sponsor for construction of a segment of the water transmission line.

Local cooperation. Section 2 of the 1938 Flood Control Act, and the 1958 Water Supply Act, as amended, apply.

Operations and results during fiscal year. Continued operation and maintenance. Flood damages prevented during FY07 are estimated at \$1,280,900; cumulative benefits are estimated at \$52,574,200. During the year 17,086 MWh of electrical energy were delivered to the Southwestern Power Administration for marketing. The project has eleven developed parks, which in FY07 experienced public visitation exceeding 19.3 million visitor-hours. An agreement to provide 21,972.14 acre-feet of storage at no charge to the Arkansas Game and Fish Commission for fish production facilities was sent to HQ for approval in July 2000. A contract was awarded to the Carroll-Boone Water District in late FY07 to provide water to Dam Site Park.

Condition at end of fiscal year. Project is complete. Alterations to existing parks to enhance fee collec-

tions, improve efficiency, and reduce the maintenance effort or rehabilitate the 26-year old park operation through operation and maintenance and SRUF funds, as appropriate. Construction of the project began in October 1959 and was placed in operation for flood control in December 1963, hydroelectric power generation with both units in May 1965, and water supply in January 1966. Work on a dam seepage problem is complete.

29. Bull Shoals Lake, AR

Location. (See table 37-K: White River Basin, AR & MO.)

Existing project. Cost with eight generating units was \$88,858,711. For further information see pages 725 and 726 of 1965 Annual Report. (For authorization see table 37-B.)

Local cooperation. Section 2, Flood Control Act of 1938 applies.

Operations and results during fiscal year. Continued operation and maintenance. Flood damages prevented during FY07 are estimated at \$3,032,800; total cumulative flood damages prevented are estimated at \$189,983,600. During the year, more than 179,262 MWh of electrical energy were delivered to Southwestern Power Administration for marketing. The project has eighteen developed parks, which in FY07 experienced public visitation exceeding 20.0 million visitor-hours. In late FY07, a design-build contract was awarded to Repair the Spillway Catwalks. In addition, the work was complete at the Bull Shoals Field Station for the new classroom building

Condition at end of fiscal year. Project is complete. Alterations to existing parks are needed to enhance fee collections, to improve efficiency, to reduce maintenance effort or to rehabilitate the 37-year-old park facilities through operations and maintenance or SRUF funds, as appropriate. Low dissolved oxygen readings in the downstream area of Bull Shoals Dam in October 1990 have resulted in ongoing studies to be undertaken to minimize harmful effects on the trout fishing of the White River.

Unguaranteed short-term solutions to the problem, consisting of limiting generation, will sustain the existing fishery, but long-term guaranteed changes will require congressional authorization. Construction of the project began in April 1946 and was ready for beneficial flood control use in June 1951 and generation of electrical energy in September 1952. Units 1 through 8 were placed in operation September 1952, December 1952, June 1953, January 1962, February 1962, August 1963, and September 1963, respectively.

LITTLE ROCK, AR DISTRICT

Major rehabilitation (Powerhouse). A major rehabilitation study was initiated in October 1995. The study was to investigate a solution to the environmentally induced reliability problem (low dissolved oxygen) of these units. Potential solutions include new auto-venting turbines, a down stream weir, turbine venting, or forced-air. Following preliminary study results, the turbines were modified in 1997 to increase downstream aeration. The study is a high priority for the division, but has been suspended due to the Major Rehabilitation Program being suspended.

30. Dardanelle Lock And Dam (No. 10), AR

Location. (See Table 37-H: Arkansas River Basin; AR, OK, and KS: Navigation.)

Existing project. Project is a unit of MKARNS. Dam is 2,683 feet long and 68 feet high. It has a spillway with 20 tainter gates 50 feet long and 39 feet high. Navigation lock is 110 by 600 feet with a lift of 54 feet. Powerhouse originally contained four 31,000-kilowatt generators. Lake has a storage capacity of 486,200 acre-feet. Estimated cost was \$84,270,124.

Local cooperation. (See section 1.)

Operations and results during fiscal year. Continued operation and maintenance. Power generation continued. During FY06, 209,025 MWh of electrical energy were delivered to the Southwestern Power Administration for marketing. In FY07, the project's thirteen developed parks experienced public visitation exceeding 7.5 million visitor-hours. In FY07, several contracts were awarded and the work complete. Included were the Repair Water Stops at the Monolith Joints, Repair the Powerhouse Roof and Install Turbine Pit Platforms.

Condition at end of fiscal year. Project is complete. Construction began June 1957. Power units were placed on line in April, May, and September 1965, and January 1966. The lock became operable in December 1969. The Visitors Center and resident office were completed in May 1985. The contract to install tow haulage equipment was completed in 1999.

Major rehabilitation. Major Rehabilitation of the power plant was completed in August 2000. Turbines were replaced and generators were rewound to increase plant capacity by 13 percent. Cost of the Major Rehabilitation was \$28.8 million.

31. Greers Ferry Lake, AR

Location.(See Table 37-K: White River, AR & MO.)

Existing project. Estimated cost is \$55,125,000. For further information see page 740 of 1964 Annual Report.

Local cooperation. Section 2, 1938 Flood Control Act and 1988 Water Supply Act, as amended, apply.

Operations and results during fiscal year. Continued operation and maintenance. Flood damages prevented during FY07 are estimated at \$580,300; total cumulative flood damages prevented are estimated at \$35,755,500. In FY06, 49,298 MWh of electrical energy were delivered to the Southwestern Power Administration for marketing. The project has seventeen developed parks, which in FY07 experienced public visitation exceeding 36.3 million visitor-hours. The project's operational management plan provides means by which the natural resources, including water quality, aesthetic value, forestry, fish and wildlife are managed and protected for future generations. An all-volunteer environmental program (annual cleanup) has been most successful and serves as a model for the Nation. During the past 27 years the program has won more than 26 national awards.

Condition at end of fiscal year. Project is complete. Construction of the project began in June 1957 and was ready for beneficial flood control use in January 1962. Power units 1 and 2 were operable in March and May 1964, and water supply was operable in April 1971. The Visitors Center was completed in June 1983 at a cost of \$813,000.

32. Norfolk Lake, AR

Location. (See Table 37-K: White River Basin, AR & MO.)

Existing project. The total estimated cost is \$70,701,629, including highway bridge construction. This does not include an estimate for the addition of power units 3 and 4, which were authorized, but never built. For further information see page 896 of 1962 Annual Report.

Local cooperation. Section 2, Flood Control Act of 1938 and Water Supply Act of 1958, as amended, applies.

Operations and results during fiscal year. Continued operation and maintenance. Flood damages prevented during FY07 are estimated at \$1,243,900; total cumulative flood damages prevented through September 2007, are estimated at \$59,373,000. During the year, more than 131,066 MWh of electrical energy were delivered to the Southwestern Power Administration for marketing. The project's 18 developed parks experienced public visitation exceeding 15.9 million visi-

tor-hours during FY07. The contract that was awarded in late FY06 to Repair Dam Roadway and Bridge was complete in FY07. Due to funding on hand, the work included only one side of the roadway.

Condition at end of fiscal year. Construction of project began in October 1940, ready for beneficial flood control use in June 1943, and for generation of electrical energy with one unit in June 1944. Second unit was added in February 1950. Water supply was added as a purpose in December 1969. Construction of two highway bridges over Norfolk Lake to replace ferries was completed in November 1982. The bridges were transferred to the Arkansas Highway and Transportation Department for operation and maintenance in July 1984.

33. Ozark-Jeta Taylor Lock And Dam (No. 12), AR

Location. (See Table 37-H: Arkansas River Basin, AR, OK, and KS: Navigation.)

Existing project. Project is a unit of MKARNS. The dam is 2,480 feet long and 58 feet above streambed; spillway has 15 tainter gates, each 50 feet long and 46 feet high. Navigation lock is 110 by 600 feet with a lift of 34 feet. Powerhouse contains five 20,000 kilowatt generators. Lake has a storage capacity of 148,400 acre-feet. In addition, one foot of power pondage is provided in Pool 13 between elevations 391.0 and 392.0. Cost was \$85,629,412. (For authorization see table 37-B.)

Local cooperation. (See section 1.)

Operations and results during fiscal year. Continued operation and maintenance. Delivered 105,627 MWh of electrical energy to Southwestern Power Administration for marketing. Ozark Lake has 10 developed parks, which in FY07 experienced public visitation exceeding 1.2 million visitor-hours. A construction contract, which was awarded in late FY06, for the Rehab of Aux Arc Park was completed in FY07. This work included a new gate house, and new camping loop and associated utilities and relocating existing campsites.

Condition at end of fiscal year. Construction began in December 1964. Project is complete. Lock and dam was placed in operation in November 1969. Power units were placed on line as follows: unit 1, November 1972; unit 2, August 1973; unit 3, October 1973; unit 4, December 1973; and unit 5, May 1974. Tow Haulage was installed in 1999.

A major rehabilitation study was initiated in October 1996. The power plant has experienced numerous mechanical problems and major repair requirements since its construction. The study describes the condition of the power plant and reviews alternative solutions. The

Rehabilitation Study Report was submitted in March 1999. Little Rock received Construction General funding in FY03 to start construction on the Major Rehabilitation Project.

34. Table Rock Lake, MO

Location. (See Table 37-K: White River Basin, AR & MO.)

Existing project. Cost was \$119,491.90. For further information see page 893 of 1962 Annual Report. (For authorization see table 37-B.)

Dam Safety (Assurance). Table Rock Dam, about eight miles upstream from Branson, Mo, does not have adequate capacity and can safely pass only 65 percent of the Probably Maximum Flood. Studies indicate the PMF would overtop the dam by more than five feet and would breach the earthen embankment portion of the dam, causing catastrophic losses in downstream areas including Branson. The project includes construction of a dam, auxiliary gated spillway, bridge over the spillway, relocation of recreational facilities destroyed by the project, and major rehabilitation of the existing spillway. The total estimated project cost is \$73.4 million.

Local Cooperation. Section 2 of the 1938 Flood Control Act applies.

Operations and Results during fiscal year. Continued operation and maintenance. Flood damages prevented during FY07 are estimated at \$3,134,500; total cumulative flood damages prevented are estimated at \$131,505,700. During the year, about 98,642 MWh of electrical energy were delivered to the Southwestern Power Administration for marketing. The District and the Waterways Experiment Station are investigating the possibilities of improving the quality of Table Rock releases with a hypolimnetic oxygenation system. Table Rock Lake has fifteen developed parks, which in FY07 experienced public visitation exceeding 16.5 million visitor-hours. This project's operational management plan provides means by which the natural resources, including forestry, fish and wildlife. In FY07, a transfer ramp was installed at the Moonshine Beach boat ramp by the JOC contractor. Also, design work resumed on the Rehab of the Dewey Short Visitor's Center.

Condition at end of fiscal year. Project is complete. Construction of project began in October 1954. The project was ready for beneficial flood control use in November 1958, and for generation of electrical energy with units 1 and 2 in May 1959. Units 3 and 4 were added in April and June 1961. The Auxiliary Spillway was completed in October of 2003.

GENERAL INVESTIGATIONS

35. May Branch, Fort Smith, AR

Location. May Branch, Fort Smith, Arkansas, enters the Arkansas River at mile 307.5.

Existing Project. The Chief of Engineers final report was signed 19 December 2006. It recommends the construction of a flood reduction project consisting of a new 2.77-mile long open channel to convey flood waters from the May Branch basin to the Arkansas River. The channel alignment would require 15 structure relocations, 5 rail and 9 road crossings, a gated hydraulic control structure at the Fort Smith (Arkansas River) Levee. The estimated project cost is \$30.85 million including two upstream reaches to be constructed at non-Federal expense. The project was authorized by WRDA 2007.

Local Cooperation: The City of Fort Smith, Arkansas, is the non-Federal sponsor. The non-Federal cost is estimated to be \$15.8 million based on WRDA 1986, as amended. On 27 October 2005, the ASA (CW) approved the recommendation that the locally preferred plan be implemented.

Operation and Results During Fiscal Year: In FY 2007, GI funds of \$2,801 were expended. The Report of the Chief of Engineers was signed 19 December 2006.

36. North Little Rock (Dark Hollow), AR

Location: North Little Rock, AR bounded by I-40 to the north, I-30 to the east, and the Arkansas River to the south.

Existing Project: The proposed project is a flood tunnel project including replacement of the existing tunnel under Redwood Street. Section 576 of the Water Resources Development Act of 1999 directed the Corps to review the plans and determine if the project is economically justified, technically sound, and environmentally acceptable and if so, construct the project.

Local Cooperation: The design cost-sharing agreement was executed with the City of North Little Rock on 30 May 2000. The Limited Reevaluation Study was initiated 26 June 2000.

Operations During Fiscal Year: The Limited Reevaluation Study was completed and necessary benefit to cost ratio did not exceed one.

37. Pine Mountain Lake, AR

Location: The project was authorized in the Flood Control Act of 1965, for a dam site at mile 35.7 on Lee Creek 12 miles north of Van Buren, Arkansas, in Crawford County.

Existing Project: Existing authorization provides for construction of a lake for flood control, water supply, recreation and fish and wildlife enhancement. The lake would control runoff from 168 square miles with a capacity of 261,000 acre-feet. A General Reevaluation Report is being prepared to comply with NEPA requirements and to update the project economic analysis.

Height of Dam: 204.5 feet above streambed
Type of Structure: Rockfill Embankment
Capacity: 261,000 acre-feet
Estimated Cost: \$140,000,000

Local Cooperation: The River Valley Regional Water District has opted to proceed at 100 percent federal financing of Preconstruction Engineering and Design (PED) activities in accordance with SWD guidance provided on September 26, 2003. The sponsor will pay their share of PED costs during the first year of construction.

Operations and Results During Fiscal Year: Congress added \$200,000 to the FY 07 budget to continue this study. The study, however, was put on hold in FY 07. Under Arkansas Department of Environmental Quality's "Extraordinary Resource Waters" (ERW) regulation, the construction of a dam on a streams with that designated was not allowed. Lee Creek, the stream on which Pine Mountain Dam is proposed for construction, is designated as an ERW stream. The ERW regulation was revised by the Arkansas Pollution Control and Ecology Commission on 28 September 2007 to allow dams to be constructed on ERW streams if (1) the sole purpose for the funding and construction of the reservoir is to provide a domestic water supply; and (2) there are no feasible alternatives to constructing a reservoir in order to meet the domestic water needs of the citizens of the state of Arkansas. This revised regulation is currently under review by EPA.

38. Springfield, MO

Location: Jordan Creek and its tributaries is located in Springfield MO. It drains into Wilson Creek in the southern end of the city.

Existing Project: A \$3,000,000 urban flood control and ecosystem restoration feasibility study initiated 12

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

May 2004 with the signing of the feasibility cost sharing agreement with the City of Springfield. The study is scheduled to be completed in 2012.

Local Cooperation: The city of Springfield, MO is the sponsor.

Operations and Results during Fiscal Year: GI funds of \$149,885 were expended in FY 2007.

39. Southwest Arkansas Study

Location: The study area includes parts or all of four counties in Southwest Arkansas in the Red River and Little River basins.

Existing Project: Construction of the four projects (Millwood, Dierks, Dequeen, and Gilham Lake) resulted in the loss of 25,000 acres of bottomland wildlife habitat. About 9,000 acres of wetlands were lost due to reservoir operations. There is a significant opportunity to reallocate storage to increase flood reduction benefits and to restore fish and wildlife habitat. Water releases from the four lakes could aid navigation on the Red River, which has been extended to Shreveport/Bossier City. Important economic factors are agriculture, poultry, and livestock operations. Accelerated runoff, sedimentation, and possible water quality problems need to be addressed.

Water supply storage could be used to make releases, especially out of Dierks and Gillham lakes, for kayaking with a resulting growth in recreational businesses. The watershed study would evaluate flooding, irrigation, restoration of fish and wildlife habitat, water quality, recreation and water releases for navigation.

Local Cooperation: The Reconnaissance study identified Federal interest. Non-Federal sponsors have been identified as Little River County, the Arkansas Natural Resources Commission and the Arkansas Game and Fish Commission. Next steps in the study are to initiate the Project Management Plan (PMP), clearly define the project scope, and negotiate the feasibility cost sharing agreement (FCSA) with the NF sponsors by 30 September 2008.

Operations and Results During Fiscal Year: Carry-over funding (\$45,000 FY03 and \$99,000 FY06) will be used to prepare a Project Management Plan, and negotiate a feasibility cost sharing agreement.

40. White River Minimum Flows, AR

Location: The area involved is the cold water trout

fisheries on the White River, the North Fork River, below the Corps' high head dams at Bull Shoals and Norfolk Lakes. Bull Shoals Dam is on the White River 7 miles upstream of Cotter, AR. Norfolk Dam is located on the North Fork River 4.8 miles northeast of Norfolk, AR.

Existing Project: The SEC. 132(A) of 2006 Energy and Water Development Appropriations Act (EWDAA) (Public Law 109-103), modifies the operation of the White River lakes to include specific amounts of project storage for the tail water trout fisheries; before this, water management decisions affecting lake levels and downstream flows were based primarily on flood control and hydropower needs. The act directs the Corps to reallocate the following amounts of storage: Bull Shoals Lake, 5 feet; and Norfolk Lake, 3.5 feet. A reallocation study was completed in FY05, but did not recommend a project for construction. Section 132 of the FY 2006 Energy and Water Resources Development Act (P.L. 109-103) authorizes the implementation of plans BS-3 at Bull Shoals and NF-7 at Norfolk lakes at full Federal expense in accordance with section 906(e) of WRDA 86. Section 132 also repealed the previous project authorities in WRDA 99 and WRDA 00, resulting in a new project.

Local Cooperation: The Federal Government will fully fund all design, construction, and maintenance of minimum flows facilities, the SWPA offset, and the FERC Licensee 2221 compensation. The State of Arkansas will fully fund relocations and/or modifications to lake-side facilities to allow reasonable continued use with respect to the storage reallocations. Section 132 of the FY 2006 Energy and Water Resources Development Act (P.L.109-103) authorizes the implementation of BS-3 at Bull Shoals and NF-7 at Norfolk Lakes.

Terminal Facilities: BS-3, Bull Shoals option 3, will require a 5-foot increase in conservation pool, and modification of the SCADA remote operating language for minimum flows implementation. BS-3 minimum flows releases will be through the existing main turbines. NF-7, Norfolk Lake option 7, will require a 1.75-foot increase in conservation pool, modification to bulk heads, modification of SCADA remote operating language, connection of the existing station service units to the power grid, and design and construction of a siphon and valve system. NF-7 minimum flows releases will be through the existing station service units and the new siphon system.

Operations During Fiscal Year: Draft Environmental Impact Statement completed and publicly reviewed, resulting in new Implementation guidance and modifica-

tions to the Draft EIS. The Feasibility portion of the project will require additional analysis and funding. PED has been initiated however Construction will not be implemented until ROD and PCA signed, necessary funds are appropriated and necessary lake facility modifications completed.

CONSTRUCTION GENERAL

41. Clearwater Major Rehabilitation Project, Clearwater Lake, MO

Location: Clearwater Dam, in Southeast Missouri on the Black River is an earthen dam 4,225 feet long and 154 feet high. The project was built for flood control and recreation.

Existing Project: Authorization for the Clearwater Dam project is the Flood Control Act of 1938 (Public Law 761, 75th Congress, 3rd Session); Authorization for the current project is a Major Rehabilitation Evaluation Report Approved by the ASA(CW) in August 2004. A Major Rehabilitation Study concluded that a new seepage cutoff wall is necessary to solve the seepage problem at Clearwater Dam. The Major Rehabilitation Report estimated the total cost of the project to be approximately \$90.3M, however the cost estimate has risen to approximately \$175.1M because of various factors. A sinkhole developed in January 2003 on the upstream face of the dam, and investigations indicate seepage is the likely cause. Seasonal pool deviation requests have been denied because of the sinkhole and the overall condition of the dam. Until the dam is rehabilitated, the pool deviations are likely to be denied. The reservoir is being operated in accordance with the approved operating plan. Results from a limited seismic analysis conducted during FY05 indicate that the dam passes the operating basis earthquake criteria, but more detailed seismic analysis will be necessary in the upcoming fiscal years. Additional studies on the spillway capacity and erosive potential may also be conducted in the future.

Local Cooperation: This is a 100 percent Federally funded project. No cost sharing is applicable, however there is extensive public interest.

Operations During Fiscal Year: FY07 activities consisted primarily of drilling and grouting operations for the Phase I project. Phase I consists of a close-spaced investigative drilling and grouting program to find and treat subsurface features that would impact the Phase II cutoff wall construction. Phase I will help define the parameters of the cutoff wall to be constructed in Phase II, as well as pretreat the rock to allow construction of the cutoff wall. Initial drilling operations have indicated

that the subsurface rock is in a condition that will require extensive grouting to facilitate construction of the cutoff wall during Phase II, extending the duration of Phase I. Also during FY07, because the condition of the rock dictated a change in the drilling and grouting procedure, the rock drilling and grouting was deleted from the original Phase I contract and a second contract was awarded to complete Phase I. This contract was designated Phase Ib and was awarded in August 2007.

The Phase Ib contract is anticipated to be completed by the end of the first quarter of FY09. The Phase II Cutoff Wall contract is expected to be awarded in late FY08. The completion of the overall project is currently scheduled for 2013.

42. Arkansas-White Cutoff Containment Structure, AR, General Reevaluation Study

Location: The Arkansas/White Cutoff is an element of the MKARNS project. The project is located in Arkansas County, Arkansas, from RM 0.0 to approximately RM 10.0 on the White River.

Existing Project: Authorization for the project is the 1946 River and Harbor Act. A natural cutoff between the lower White and Arkansas Rivers was closed during the development of the McClellan-Kerr Arkansas River Navigation System (MKARNS). During the 1970's and 1980's, a new cutoff began to develop upstream in the Melinda Channel-Owens Lake corridor and in 1989, construction of a more extensive set of structures, known as the Arkansas/White Cutoff Containment Structure, was initiated in an attempt to prevent continued development of the cutoff. However, cutoff development has continued and threatens to breach the land between the two rivers. Since the headcut containment structure was completed in 1992, the Corps has continued to expend construction funds to reduce the possibility of a cutoff.

Local Cooperation: This is a 100 percent Federally funded study, under the authorization for the MKARNS. No cost sharing is involved. However, close coordination with and active participation by environmental and private landowner interests is critical to successful completion of the project.

Operations During Fiscal Year: Activities during FY07 consisted primarily of alternative comparison and report writing to complete the General Reevaluation Report. Funding for FY07 activities was obtained carry-over funds from FY06.

The damaged structure at the south end of Jim Smith Lake remained unrepaired and continues to cause a high

probability of a new cutoff. Construction of this approximate \$1.4M repair is contingent of available funds.

Funding was not appropriated for this project in FY06 or FY07.

43. McClellan-Kerr Arkansas River Navigation System (MKARNS) 12-Foot Channel, AR AND OK

Location: The project area includes the entire 445 miles of the McClellan-Kerr Arkansas River Navigation System in Arkansas and Oklahoma (See Section 1).

Existing Project: The existing McClellan-Kerr Arkansas River Navigation System begins at the mouth of the White River at the Mississippi River; runs up the White River for approximately 10 miles and then enters the Arkansas Post Canal. The Arkansas Post Canal is approximately 9 miles long and connects the White River and the Arkansas River. The system proceeds up the Arkansas River to approximate navigation mile 395 where it enters the Verdigris River. The system continues up the Verdigris River to the Head of Navigation at navigation mile 444.8 at the Port of Catoosa. There are 18 existing locks and dams on the system. This project will increase the minimum depth of the system from 9 feet up to 12 feet and make changes to the flow management plan.

Local Cooperation: Because this project is part of the inland navigation system, study costs were 100 percent Federal costs. It was determined that all remaining construction activities will be cost shared 50/50 with the Inland Waterway Trust Fund.

Operations During the Fiscal Year: Work was initiated on Preconstruction Engineering & Design (PED, Construction, and Mitigation in FY 2006. The FY 05 Senate request for OM appropriation of \$7M in O&M funds were received in FY 05 and carried over for FY 06 and FY07 efforts. In FY08 remaining funds will be expended on adding three stone structures near Navigation Mile 146, and design of upland dredge disposal sites in Oklahoma .

44. Ozark Powerhouse Major Rehabilitation Project, Arkansas River, AR

Location: The project is located on the Arkansas River at River Mile 256.8 near Ozark, Arkansas.

Existing Project: A Major Rehabilitation Study was completed in 1999, which recommended replacement of the existing turbines with modern, state-of-the-art units. Funds were appropriated in FY 2003, FY 2004, and

2005. There were no appropriations in FY 2006 or FY 2007. This project consists of redesigning and replacing the turbines, rehabilitation of the powerhouse cranes, and replacement and rehabilitation of supporting systems and equipment. The project restores the Ozark Powerhouse output capacity and power output to the original as-built conditions. Allocations through FY07 were \$5,395,000. The Current Project Estimate is \$88,370,000.

Local Cooperation: In 2005, the Southwest Power Pool hydropower customers agreed to supply supplemental funding through a Memorandum of Agreement between the Corps of Engineers, Southwestern Power Administration and the City of Jonesboro (representing the Federal power customers), which was signed in 1999. This supplemental funding was used to prevent contract shutdown due to shortage of appropriated funds in FY 2006 and FY 2007.

Operations During Fiscal Year: Efforts in FY 07 included fabrication of the first turbine to be replaced, and preparation for onsite mobilization. The customer provided \$20.1 M to continue work during FY 06 and FY 07. Estimated Completion date is October 2012. Project is approximately 23% complete.

45. Beaver Dam Trout Production Facilities, White River, AR

Location: The Trout Production Facility is to be located just below Beaver Dam in Carroll County to annually grow out 150,000 pounds of trout for environmental restoration to mitigate for the loss of the warm water fishery in the Beaver tailwater.

Existing Project: Section 132, EWDA 2006, directed that losses to hydropower shall be offset by a reduction in Federal hydropower costs as determined by Southwestern Power Administration based on the present value of the estimated replacement cost of the energy and capacity when the hatchery operation begins.

Local Cooperation: By letter dated Sept. 27, 2001, ASA (CW) stated that the legislative intent for the trout production facility, including a source of water supply, would be at Federal expense up to \$6 million. On 27 November 2007, ASA (CW) made a determination that the 21,972 acre-feet of conservation pool storage and its OMRR&R for the trout production facility is to be at no cost to the state of Arkansas.

Operations During Fiscal Year: The reallocation report efforts are conducted using Federal Operation and

LITTLE ROCK, AR DISTRICT

Maintenance funds.

**CONTINUING AUTHORITY PROGRAM
NAVIGATION ACTIVITIES (SECTION
107)**

46. Slack Water Harbor, Russellville, AR

Location: The project area is located along the McClellan-Kerr Navigation System approximately 75 miles northwest of Little Rock. The local sponsor is the River Valley Regional Inter-modal Facility Authority.

The plans and specifications were initiated in October 2002 and were put on hold in September 2003 at the 50% design per the sponsor's request. The Corps was sued by environmental groups in the spring of 2004 with the major compliant being an EIS should have been done on the whole intermodal facility. FHA, the lead agency for the intermodal facility's EIS, prepared the Draft EIS dated February 2006. The final EIS is scheduled for completion July 2007. The Corps has been a cooperating agency in the preparation of the EIS

The total project cost of the harbor is estimated at \$7,116,000, and the benefit-to-cost ratio is 1.3 to 1. The total federal share will be limited to the amount named, or \$3,350,000. The total non-federal share was estimated at \$3,876,000.

Fiscal Year Cost: Congressional adds in the amount of \$1 million for FY01, \$1 million for FY02, \$500K in FY03, \$851K in FY04, and \$150k in FY06, have been included in the appropriations bills. Administration policy is total federal project costs are limited to the total amount named, \$3.5M. FY06 funds of \$200,000 were used to complete the plans and specs in September 2006. Payback funds in the amount of \$2,839, 000 are expected in FY07 for construction

Funds Spent Thru FY05: \$311,000
Funds Spent in FY06: \$200,000
Federal Share \$120,704

**EMERGENCY BANK PROTECTION
(SECTION 14)**

**47. BATESVILLE WASTEWATER
TREATMENT PLANT, BATESVILLE, AR**

Location: Batesville, Arkansas is located approximately 90 miles northeast of Little Rock, Arkansas.

Fiscal Year Cost:

Funds spent through FY07: \$ 253,400
Funds spent in FY07: \$49,000

47. Fourche Creek Sewer Main, Little Rock, AR

Location: Fourche Creek is a tributary of the Arkansas River. Project location is at the Little Rock National Airport in Little Rock, Arkansas.

Fiscal Year Cost:

Funds spent through FY06: \$ 0
Funds spent in FY07: \$ 0

48 Highway 71 @ Red River, Ogden, AR

Location: Ogden, Arkansas is located approximately 150 miles southwest of Little Rock, Arkansas. The PPA was signed. The project will be constructed in FY08.

Fiscal Year Cost:

Funds spent through FY06: \$ 72,751
Funds spent in FY07: \$ 3,568

49. I-40 @ Spadra Creek

Location: Clarksville, Arkansas is located approximately 100 miles west of Little Rock, Arkansas. This project was terminated due to lack of sponsor support.

Fiscal Year Cost:

Funds spent through FY07: \$ 0
Funds spent in FY07: \$ 0

50. Little Piney Creek, Highway 164

Location: The project is located at the bridge over Little Piney Creek on State Highway 164 near Hagarville, Johnson County, Arkansas. The PPA was signed. The project will be constructed in FY 08.

Fiscal Year Cost:

Funds spent thru FY 06: \$83,163
Funds spend in FY 07: \$58,832

**FLOOD CONTROL ACTIVITIES
(SECTION 205)**

51. Archey Fork Creek, Clinton, AR

Location: Archey Fork Creek is located in Clinton, Arkansas, approximately 75 miles north of Little Rock, Ar-

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

kansas. The milestone was completed. We are working on the FCSA.

Fiscal Year Cost:

Funds spent through FY06: \$ 42,000
 Funds spent in FY07: \$ 14,907

52. Hester, Heartsill, and Adamson Greenwood, AR

Location: Greenwood, Arkansas is located approximately 20 miles south of Ft. Smith in western Arkansas. We are working on the FCSA.

Fiscal Year Cost:

Funds spent through FY06: \$ 43,000
 Funds spent in FY07: \$ 8,446

53. High School Branch, Neosho, MO

Location: High School Branch is located in Neosho, Missouri, approximately 17 miles south of Joplin, Missouri.

Fiscal Year Cost:

Funds spent through FY06: \$ 69,000
 Funds spent in FY07: \$ 0

54. Howell Creek, West Plains, MO

Location: West Plains, Missouri is located approximately 100 miles east of Branson in southern Missouri. Howell Creek flows through the town. We are working on the milestone report

Fiscal Year Cost:

Funds spent through FY06: \$ 50,000
 Funds spent in FY07: \$ 12,995

55. Jam Up Creek, Mountain View, MO

Location: Mountain View is located in south central Missouri in Howell County approximately 100 miles east of Springfield.

Fiscal Year Costs:

Funds spent through FY06: \$157,200
 Funds spent in FY07: \$25,600

56. Prairie Creek, Russellville, AR

Location: Prairie Creek is located in Russellville, Arkansas, approximately 70 miles west of Little Rock, Ar-

kansas. Project was terminated.

Fiscal Year Cost:

Funds spent through FY06: \$ 44,188
 Funds spent in FY07: \$ 10,546

57. Sulphur Creek, Tributary 10, Heber Springs, AR

Location: Heber Springs is located about 65 miles north of Little Rock. We are working on the milestone report.

Fiscal Year Costs:

Funds spent through FY06: \$ 23,968
 Funds spent in FY07: \$ 7,897

58. Town Branch, Newark, AR

Location: Newark is located about 15 miles west of the city of Newport. Funds were received in FY07. The project is to be terminated due to insufficient flood damages..

Fiscal Year Costs:

Funds spent through FY06: \$41,286
 Funds spent in FY07: \$ 41,176 0

59. White River, Oil Trough, MO

Location: Oil Trough is located about 90 northeast of Little Rock, This project has never received any funds and is the project backlog.

**ENVIRONMENTAL RESTORATION
 (SECTION 1135)**

60. AR River Environmental Restoration Project

Location: The area to be restored is between Russellville and Fort Smith. No funds were received in FY07. This project is on hold.

Fiscal Year Costs:

Funds spent through FY06: \$5,000
 Funds spent in FY07: \$ 0

61. Bull Shoals Lake Tail Water Restoration, AR

Location: This project is located below Bull Shoals Dam in Arkansas. The PPA will be signed in FY 08

LITTLE ROCK, AR DISTRICT

Fiscal Year Costs:

Funds spent through FY06: \$150,000
Funds spent in FY07: \$265

62. Bull Shoals Nursery Pond

Location: Bull Shoals Dam is located at river mile 418.6 on the White River in the Ozark Mountains of north central Arkansas (near the Arkansas-Missouri border) approximately 10 miles northwest of Mountain Home, Arkansas, and 115 miles north of Little Rock, Arkansas..

Fiscal Year Costs:

Funds spent through FY07: \$1,511,600
Funds spent in FY07: \$9,000

63. Millwood Lake, Grassy Lake, AR

Location: Grassy Lake, a pristine wetland, is just downstream of Millwood Dam along Yellow Creek in southwest Arkansas. The Red River Basin dams reduced the beneficial flooding of Grassy Lake. Study was initiated in 2004 with a Congressional earmark.

Fiscal Year Costs:

Funds spent through FY06: \$58,725
Funds spent in FY07: \$45,654

64. Norfolk Tailwater Habitat

Location: The Lake Norfolk Tailwater approximately 5 miles in length below the dam in Baxter County, AR.

The Arkansas Game and Fish Commission requested an ecosystem restoration study to address the impacts to the tailwater trout fishery below Norfolk dam. The timing, duration and magnitude of hydropower releases from Norfolk Dam has caused increased stream bank erosion and degraded the fish habitat components. This project will improve aquatic habitat, improve water quality (reduce sedimentation), and increase productivity of the biological community. These improvements are needed in order to restore Rainbow and Brown Trout habitat that has been degraded and lost due to project releases. In FY03, \$10,000 was allocated for development of a PRP, which was forwarded to SWD in May 2004. No additional funding has been received.

Fiscal Year Costs:

Funds spent through FY06: \$10,000
Funds spent in FY07: \$0

65. Rock Creek At Boyle Park, Little Rock, AR

Location: The area of concern on Rock Creek is located in and surrounding the vicinity of Boyle Park in Little Rock, AR.

The park is an approximately 250-acre tract of largely unimproved woodland donated to the city by Dr. John F. Boyle in 1929. The area is a mix of residential and commercial activity. It was determined by the project delivery team that the study area should encompass the area between Kanis Park and 36th street in Little Rock, AR., roughly 2 miles.

Fiscal Year Costs:

Funds spent through FY06: \$10,000
Funds spent in FY07: \$0

66. Taylor Bay, Woodruff County, AR

Location: Taylor Bay is located in Woodruff County, Arkansas, immediately north of Augusta or approximately 60 miles northeast of Little Rock.

Fiscal Year Cost:

Funds spent through FY06: \$ 56,700
Funds spent in FY07: \$ 0

**ENVIRONMENTAL RESTORATION
(SECTION 206)**

67. Fourche Creek At Hindman Park, LR, AR

Location: The Project is located on Fourche Bayou in Little Rock AR.

The City of Little Rock, the Audubon Society and the Arkansas Game and Fish Commission have requested that the Little Rock District Corps of Engineers initiate a Section 206 ecosystem restoration study on Fourche Creek in the area of Hindman Park in southwest Little Rock. The stream in this area is experiencing bank erosion problems probably as a result of altered hydrology caused by development in the upstream watershed. In FY03, \$10,000 was allocated for development of a Preliminary Restoration Plan (PRP). The sponsors along with the Corps are currently working on defining the scope of the project since much of the upstream watershed is in private ownership. The PRP was completed in summer 2004. The Arkansas Highway Department and Federal Highway Administration have also expressed an interest in purchasing mitigation property adjacent to Fourche Creek in this area for added restoration and enhancement. Current work is suspended pending funding.

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

Fiscal Year Costs:

Funds spent through FY06: \$ 8,514
Funds spent in FY07: \$ 0

68. Galla Creek, AR

Fiscal Year Costs:

Funds spent through FY06: \$10,909
Funds spent in FY07: \$ 0

Location: The project area is located along the McClellan-Kerr Navigation System approximately 75 miles northwest of Little Rock. The local sponsor is the River Valley Regional Inter-model Facility Authority.

The recommended plan consists of modifying and re-storing 6286 linear feet of channel upstream, 3763 linear feet of channel downstream, lowering an existing steel spillway structure 2 feet, removing an existing concrete pad as an option, adding four stop-logs to an existing structure, and re-establishing approximately 400 acres of bottomland hardwoods. The spillway will be lowered 2 feet to allow better drainage of the wildlife management area and four additional weir openings with stop logs will be added. Reforestation of 400 acres is needed to get a jump-start on certain preferred wildlife tree species, preferably Overcup Oaks and Willows. The estimated cost to implement the project is \$1,404,900 and would be cost-shared 65% Federal and 35% AG&FC, or \$913,200 and \$491,700 respectively. AG&FC's share of the project will consist of the following: \$225,800 in lands, \$144,000 in work-in-kind consisting of providing material and labor for the re-vegetation of 400 acres, and \$121,900 in cash. Operation and maintenance (O&M) of the proposed project would be the responsibility of AG&FC and would primarily consist of operating, inspecting and maintaining the drainage structure and is estimated at \$1,000 per year.

Fiscal Year No funds were received in FY07. This project is on hold.

Funds Spent Thru FY06: \$121,624
Funds Spent in FY07: \$ 0

69. Shirey Bay Rainey Brake Wildlife Management Area (WMA)

Location: The WMA is a 10,500-acre tract set between the Strawberry and Black Rivers in Lawrence County, Arkansas

The Arkansas Game and Fish Commission requested an ecosystem restoration study to address the impacts to wintering waterfowl associated with riverbank erosion and water level management within a green tree reservoir. Bank erosion is threatening a portion of the levee system. In FY03, \$10,000 was allocated for development of a PRP which was forwarded to SWD in December 2004. No additional funding has been received.

TULSA, OKLAHOMA, DISTRICT

The civil works boundary of the Tulsa District includes an area of approximately 160,000 square miles covering Oklahoma and parts of Kansas and Texas within the Arkansas and Red River Basins. The District's responsibilities within the Arkansas River Basin cover southern Kansas, northern Oklahoma, and the Texas Panhandle. These areas are included in the drainage basin of the Arkansas River and its tributaries above the mouth of the Poteau

River, extending to the Kansas-Colorado State line, exclusive of that portion of the South Canadian River Basin and its tributaries west of the Texas-New Mexico State line. The District's responsibilities within the Red River Basin cover the northern portion of Texas, and the southern portion of Oklahoma. These areas are embraced in the drainage basin of the Red River and its tributaries above Index Arkansas.

Navigation

1. McCLELLAN-KERR ARKANSAS RIVER NAVIGATION SYSTEM (Tulsa District Portion), OK

Location. The Tulsa District portion of the McClellan-Kerr Arkansas River Navigation System provides a navigation route up the Arkansas River from the Oklahoma-Arkansas State line to the head of navigation at Catoosa, OK, near Tulsa, OK. The total length of the Tulsa District portion of the system is 137 navigation miles. Descriptions and costs for the entire navigation system can be found in Little Rock District’s entry in this Annual Report.

Existing projects. The McClellan-Kerr Arkansas River navigation project is a component of the multiple-purpose plan for the Arkansas River Basin, which provides for the improvement of the basin through the construction of coordinated developments for navigation, hydroelectric power, flood control, water supply, water quality control, sediment control, recreation, and fish and wildlife propagation. The McClellan-Kerr project also includes bank stabilization, channel straighten-

ing, and cutoffs as required. The navigation channel has a minimum depth of 9 feet and minimum widths of 250 feet on the Arkansas River and 150 feet on the Verdigris River. The Tulsa District portion of the navigation system consists of Arkansas River Bank Stabilization and Channel Rectification, Chouteau Lock and Dam, Newt Graham Lock and Dam, Robert S. Kerr Lock and Dam and Reservoir, Robert S. Kerr Marine Terminal, Sans Bois Navigation Channel, W.D. Mayo Lock and Dam, Webbers Falls Lock and Dam, and the pool in Oklahoma which was created by Lock and Dam 13 in Arkansas. The other parts of the multiple-purpose plan for the Arkansas River Basin are listed in Table 29-H. Public Law 108-137 authorized a 12-foot channel on the McClellan-Kerr Arkansas River Navigation System. The Corps is now positioning itself to operate and maintain the system as a 12-foot channel. Deepening the remainder of the channel to 12 feet will allow carriers to place 43% more cargo on barges, which will reduce the amount of fuel consumed and emissions released. Funds in the amount of \$7M were allocated in FY05 for this deepening project with \$1.5M used to complete the feasibility study and

TULSA, OK, DISTRICT

Environmental Impact Statement with the other \$5.5M used on engineering, design and construction activities in Tulsa and Little Rock Districts. FY 2007 activities included completion of the mussel and gravel surveys as well as designing six upland dredge disposal sites. In conjunction with the deepening project, the Corps is preparing a Basin Wide Master Plan that will include an integrated major maintenance construction and operation maintenance prioritized list for investment opportunities. Other environmental benefits include the creation of new aquatic habitat through new dike construction and the construction of Least Tern islands through beneficial use of dredged material.

Local cooperation. Fully complied with.

Terminal facilities. Public port facilities are in operation at Muskogee and Catoosa, OK, and Fort Smith, AR. Other private commercial port facilities are complete and in operation at eight Oklahoma locations.

Operations and results during fiscal year. Installed new CXT RR and playground in Bluff Landing, Installed flagpoles in both Bluff and Afton Landing, Constructed six courtesy docks (3 installed at Bluff and 3 will be installed at Afton) Installed 3 new park benches each in both Bluff and Aft. Completed dewatering and Inspection of W D Mayo Lock to include repair of damage to upstream Miter Gates, replace anodes, grease lines and Air Bubbler System. Routine operation and maintenance continued. Utilized innovated sedimentation excavation methods to remove shoaling deposited in the Navigation Channel during the 2007 Flood Event. Routine operation and maintenance dredging was performed at various locations on the system (MKARNS - to include McClellan Kerr locations) to remove shoaling from the 2007 Flood Event. Routine operation and maintenance continued.

2. OTHER AUTHORIZED NAVIGATION PROJECTS

See Table 38-C.

Flood Control

3. ARCADIA LAKE, OK

Location. On the Deep Fork River, at river mile 218.3, in the metropolitan area of Oklahoma City and Edmond, OK, about 1.5 miles west of Arcadia, in Oklahoma County, OK. (See Arcadia, OK, Geological Survey map, scale 1:24,000.)

Existing project. The plan of improvement provides for flood control, water supply, and recreation by construction of an earth fill dam approximately 102 feet high and 5,250 feet long with a high-level uncontrolled spillway. Outlet works consist of a gated tower and conduit. The lake has a total capacity of 92,000 acre-feet (27,380 for conservation, 64,430 for flood control, and 190 for sedimentation reserve), and controls a 105-square-mile drainage area. Construction began in October 1980, and the project became operational for flood control in November 1986.

Local cooperation. The city of Edmond, Oklahoma and the Edmond Public Works Authority has not met the repayment obligations in its water storage agreement as required by the Water Supply Act of 1958 and the Consent Decree between the city of Edmond, Edmond Public Works Authority and the United States Government. PL 87-88, Section 10 which amended Section 301 (b) of the Water Supply Act of 1958, required the city of Edmond to enter into an agreement to repay 100 percent of the water storage costs before the Arcadia Lake project was constructed. Issues relating to the water supply storage were litigated in United States of America v. City of Edmond and Edmond Public Works Authority. Edmond entered into a Consent Decree with the United States Government on February 10, 1992 agreeing to repay all costs associated with present and future use water storage costs as required in the water storage agreement and Consent Decree. The agreement was developed under the Water Supply Act of 1958 that states that no payment need be made on future water supply storage until such supply is first used, but in no case shall the interest-free period exceed 10 years. The city of Edmond activated the future use storage in 1999; however, the 10-year interest free period expired on November 30, 1996. The city of

Edmond disagrees with payment of accrued interest from the end of the 10-year interest free period, November 30, 1996 to the date it placed the future use storage into an active status, September 1999. The Water Resources Development Act of 2007 contained language that provides that the payments made by the city of Edmond, Oklahoma to the Secretary in October 1999 of all costs associated with present and future water storage costs at Arcadia Lake, Oklahoma, under Arcadia Lake Water Storage Contract Number DACW56-79-C-0072 shall satisfy the obligations of the city under that contract. The city of Edmond will continue to be responsible for their pro rata share of the joint-use operation and maintenance costs plus any repair, rehabilitation or replacement costs as stipulated in the contract .

Operations and results during fiscal year. During the late June and early July flood event, project personnel were on 24-hour structure surveillance for approximately 2 weeks. Routine operation and maintenance continued.

4. ARKANSAS CITY, KS

Location. Arkansas City is located approximately 4 miles north of the Kansas-Oklahoma state line at the crossroads of U.S. Highway's 77 and 166, in Cowley County, KS, immediately northwest of the confluence of the Arkansas and Walnut Rivers.

Existing project. The project consists of raising and extending approximately 6 miles of levee along the Arkansas and Walnut Rivers, and rechanneling approximately 2-1/2 miles of the Walnut River. Structural steel gates will be constructed at two railroad/river crossings and stop log structures will be constructed at two U.S. Highway/river crossings.

Local cooperation. A Project Cooperation Agreement was signed on September 4, 1996. The city of Arkansas City, the local sponsor, is currently fulfilling their requirements.

Operations and results during fiscal year. Routine operation and maintenance.

5. ARKANSAS-RED RIVER BASINS CHLORIDE CONTROL PROJECTS, KS, OK, AND TX

Location. On certain tributary streams of the Arkansas and Red Rivers in the western half of the Tulsa District.

Existing project. The project was initiated as a result of studies involving the control of water pollution caused by 15 natural salt sources identified in 1957 by the U.S. Public Health Service. The Arkansas and Red Rivers are major national and regional water resources, which are severely limited due to poor water quality primarily caused by the natural pollutant, sodium chloride. The Arkansas River is polluted by five naturally occurring salt sources located in northwestern Oklahoma and southwestern Kansas. The Red River Basin is polluted by 10 naturally occurring salt sources located in northwestern Texas and southwestern Oklahoma. Preliminary Feasibility Studies included the construction and subsequent maintenance of an injection well and a ring dike used for data collection. Preauthorization studies completed in 1966 and 1970 recommended construction of project features at 13 of the 15 chloride emission areas. For a detailed discussion of the chloride control projects, see page 19-4 of the Annual Report for 1983. The Water Resources Development Act (WRDA) of 1986 (PL 99-662) authorized the Red River Basin and the Arkansas River Basin as separate projects with separate authority under Section 203 of the Flood Control Act of 1966. The Arkansas River portion of the project was deferred in 1982 (not economically justified).

5a. AREA V, ESTELLINE SPRINGS, TX

Location. Chloride Control Area V is located about 0.5 miles east of Estelline, TX, on the Prairie Dog Town Fork of the Red River.

Existing project. For a description of the completed improvement, see the Annual Report for 1987. Construction started in 1963, and the structure was completed in 1964.

Local cooperation. Descriptive text concerning local cooperation requirements is given on page 19-5 of the Annual Report for 1983.

Operations and results during fiscal year. Routine operation and maintenance continued.

5b. AREA VIII, TX

Location. Chloride Control Area VIII is located at river mile 74.9, of the South Fork of the Wichita River, in King County, TX, about 5 miles east of Guthrie, TX.

Existing project. The plan of improvement consists of a low-flow brine collection dam (the Bateman Low-Flow Dam) with attendant pumping station and pipeline facilities. The collected brine is pumped to the storage reservoir behind the Truscott Brine Dam. This brine dam, located at river mile 3.6 on Bluff Creek (a tributary of the North Fork of the Wichita River) about 3 miles northwest of Truscott, TX, contains collected brine from Area VIII and will contain brine collected in the future from Areas X and VII. Construction was initiated at Area VIII and Truscott Brine Dam in 1976. The Bateman Low-Flow Dam was completed and put into full operation in May 1987.

Local cooperation. Descriptive text concerning local cooperation requirements is given on page 19-5 of the Annual Report for 1983.

Operations and results during fiscal year. Installed additional storage capacity (surge tanks-one each at Peak Surge and Valve Bldg) to enhance control features of Area VIII pipeline. Pulled/rehabbed mainline pump at Bateman Pump station. Improved slope protection at Bateman Pump station. Routine operation and maintenance continued.

5c. RED RIVER BASIN CHLORIDE CONTROL, TX & OK

Location. The project is located in Cottle, Hall, and King Counties, TX, and Harmon County, OK, along the Wichita and Red Rivers. Area VI is located on the Elm Fork of the Red River in Harmon County, OK; Area VII is on the North Fork of the Wichita River, Cottle County, TX; Crowell Brine Dam is on Canal Creek, a

tributary of the Pease River; Area IX is on the Middle Pease River, Cottle County, TX; Area X is on the Middle Fork of the Wichita River, King County, TX; and Areas XIII-XIV are on the Jonah and Salt Creeks of Prairie Dog Town Fork of the Red River, Hall County, TX.

Existing project. The plan of improvement consists of one deep-well injection system, three brine storage reservoirs, four low-flow brine collection dams, two well collection facilities, six pumping plants, and 56.3 miles of pipeline. Construction was completed at Estelline Springs, Area VIII (low-flow dam, pump station and pipeline), Area X (low-flow dam and pump station) and Truscott Lake. In 1987, Area VIII began operation, pumping brines to Truscott Lake.

Local Cooperation. Section 1107 of the Water Resources Development Act of 1986 authorized the project at full Federal expense. The Red River Authority of Texas has signed a 221 Agreement as the non-Federal sponsor.

Operation and results during fiscal year. A draft Supplement to the Final Environmental Impact Study (SFEIS) was submitted for public review in May 1995. Finalization of the SFEIS has been put on hold indefinitely and the Assistant Secretary of the Army for Civil Works directed that a reevaluation of the Wichita River Basin be performed with available funding. The Wichita Basin Reevaluation effort was completed and a Record of Decision (ROD) was executed in March 2004. Efforts are underway to complete the Wichita Basin portion of the project. Reevaluation efforts have been initiated for Area VI, Elm Fork Basin, OK.

6. BIRCH LAKE, OK

Location. On Birch Creek at river mile 0.8, about 1.5 miles south of Barnsdall, in Osage County, OK. (See Barnsdall, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see the Annual Report for 1979. Construction began in

November 1973, and the project was placed in useful operation in March 1977.

Local cooperation. Fully complied with.

Operations and results during fiscal year.

Installed new piezometers and relief wells. Routine operation and maintenance continued.

7. BOWIE COUNTY LEVEE, TX

Location. Bowie County is located in northeastern Texas, along the Red River, near Texarkana, Texas. The Bowie County Levee is situated on the south side of the Red River and extends almost 9 miles from the Kansas City Southern Railroad embankment westward to an area near Wamba, Texas. (See Wamba, TX, Geological Survey map, scale 1:24,000.)

Existing project. The project, as authorized under the Flood Control Act of 1946, provides for the rehabilitation of the existing Bowie County, Texas, Levee. The levee was constructed in 1913 by the Bowie County Levee District No. 1. The Bowie County Levee is part of a levee system, which includes the Miller County Levee that extends downstream approximately 35 miles. The existing Bowie County Levee does not meet current design standards and has not received proper maintenance. Studies completed in 1994 indicated that no economically feasible flood control alternative was identified and Federal interest in pursuing detailed design and project construction was not warranted. Legislation passed in FY 01 re-authorized the project to include rehabilitation of approximately 6 miles of the existing levee and construction of approximately 4 miles of new levee. This project will be constructed at an estimated cost of \$15,500,000.

Local cooperation. The Government has determined that this project will be cost-shared in accordance with the Flood Control Act of 1936.

Operations and results during fiscal year.

Project Design Memorandum was updated. Plans and specifications were completed and a new cost estimate was formulated. The wildlife habitat mitigation plan was finalized and a new environmental assessment was drafted. Section 106 archaeological coordination was completed.

Discussions relevant to the validity of the existing regional variance for vegetation were initiated.

8. CANDY LAKE, OK

Location. On Candy Creek, a tributary of Bird Creek in the Verdigris River Basin, at river mile 1.9. The damsite is about 1.5 miles northeast of Avant in Osage County, OK. (See Avant, OK, Geological Survey map, scale 1:24,000.)

Existing project. The plan of improvement provides for an earthfill dam about 4,200 feet long, including an uncontrolled concrete spillway, with a maximum height of 103 feet above the streambed. Outlet works will consist of a gated intake structure, a 10x11.25-foot conduit, and a stilling basin. An 18x24-inch low-flow pipe and an 18-inch water supply pipe will be provided. The lake will have a total capacity of 75,420 acre-feet (44,160 for conservation and sediment reserve and 31,260 for flood control). The drainage area above the damsite is 43 square miles. Candy Lake will be operated as a unit of a seven-lake system for flood control in the Verdigris River Basin in Oklahoma. Funds were not provided to complete construction and in 1996 deauthorization of Candy Lake was published in the Federal Register.

Local cooperation. Section 2 of the Flood Control Act of 1938, the Water Supply Act of 1958, and Section 221 of the Flood Control Act of 1970, apply.

Operations and results during fiscal year. WRDA 99 mandated selling deauthorized project lands back to the former owners or their descendants. With funds of \$360,000 provided in FY 03, the sale of land will be completed. Transfers have been completed on 20 of the 27 tracts have been sent to ASA(CW) for signature. The remaining tracts were investigated for presence of CR. Expect sales to complete on remaining tracts in summer 2007.

9. CANTON LAKE, OK

TULSA, OK, DISTRICT

Location. On the North Canadian River at river mile 394, about 2 miles north of Canton in Blaine County, OK. (See Canton, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 590 of the Annual Report for 1969. Construction began in December 1940, and the project was placed in useful operation in April 1948. A Dam Safety Report was submitted to HQUSACE in March 2001. The purpose of the report was to evaluate and select an alternative to address the inability of the project to safely pass the Probable Maximum Flood (PMF). In 2005, Canton was included in a HQ's Screening Portfolio Risk Assessment on the 10% highest risk dams within the Corps.

Local cooperation. The Canton Lake Committee was established to improve coordination and communication between the multi-purpose users of Canton Lake. The committee coordinates Oklahoma City's water supply release schedule with interested parties to minimize impacts.

Operations and results during fiscal year. Continued Dam Safety construction activities. FY07 activities included awarding the \$1,000,000 slurry trench contract and the \$1,800,000 channel optimization modeling contract as well as working on the design and plans and specifications for the channel excavation contract, and the project office remodel contract. Additional activities included design activities for the FY08 road relocation project. During the late May and early July flood event, project personnel were on 24-hour structure surveillance at three different projects for approximately 3 weeks. Recovery from damage caused by the pool level rising five foot above the top of the conservation pool continued thru the end of the FY. Routine operation and maintenance continued.

10. COPAN LAKE, OK

Location. On the Little Caney River, a tributary of the Caney River, in the Verdigris River Basin, at river mile 7.4, about 2 miles west of Copan in Washington County, OK. (See Copan, KS, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 19-7 of the Annual Report for 1983. Copan Lake is operated as a unit of a seven-lake system for flood control in the Verdigris River Basin in Oklahoma. Construction began in November 1972, and the project was placed in useful operation in April 1983.

Local cooperation. Fully complied with.

Operations and results during fiscal year. The reallocation study to identify water supply for the city of Bartlesville was approved by HQ in September 2007. Bartlesville postponed signing the water storage agreements associated with the reallocation until a Planning Assistance to States study to identify alternative sources of water supply was completed. The study was completed and a draft was forwarded to Bartlesville on December 31, 2007. The city will make a decision on the water supply after carefully considering all of its options. A decision by the city is expected in the spring of 2008. The draft reallocation report and water supply contracts were submitted to HQ in April 2006. Approval by HQ could take up to a year. During the late June and early July flood event, project personnel were on 24-hour structure surveillance for approximately 3 weeks. Recovery from damage caused by the pool level going above the top of the flood pool continued thru the end of the FY. Routine operation and maintenance continued.

11. COUNCIL GROVE LAKE, KS

Location. On the Grand (Neosho) River at river mile 450, about 1.5 miles northwest of Council Grove, in Morris County, KS. (See Council Grove Lake, KS, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 519 of the Annual Report for 1969. Construction began in June 1959, and the project was placed in useful operation in July 1964.

Local cooperation. Fully complied with.

Operations and results during fiscal year.

The Kansas-Oklahoma Conference of the United Church of Christ requested a land exchange involving property they currently lease. A Congressional Add in 2004 provided \$80,000 to the Corps for administrative costs associated with the land exchange. All preliminary real estate actions for the exchange were completed in 2004. The exchange of property was delayed in the late 2004 due to the discovery of an archaeological National Historic Preservation Act of 1966, the site must be investigated to determine if it is eligible for listing on the National Register. The investigation is scheduled for the first quarter of calendar year 2005. Congressional add funding was utilized to repair roads in Ritchie Cove and Santa Fe parks. Installed new septic system for new CXT toilet in Santa Fe Trail. Installed fire wall in Lake Office shop area. Routine operation and maintenance continued.

12. EL DORADO LAKE, KS

Location. On the Walnut River, a tributary of the Arkansas River, at river mile 100.2, about 4 miles northeast of El Dorado in Butler County, KS. (See El Dorado, KS, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 19-7 of the Annual Report for 1983. El Dorado Lake was authorized as a unit of a three-lake system for flood control in the Walnut River Basin. Construction began in October 1973, and impoundment began in June 1981. Project is complete.

Local cooperation. By payment of \$8.17 million on May 18, 1997, the Kansas Department of Wildlife and Parks has fully complied with the Recreation Local Cooperation Agreement.

Operations and results during fiscal year. WRDA 99 mandated the transfer without consideration of 51.98 acres of land to the state of Kansas for use as Honor Camps. The state of Kansas must pay for the administrative costs of the land transfers. A letter was sent to the state of Kansas informing the state of the administrative costs. The state of Kansas is not interested in paying the administrative costs and is not pursuing the land transfer. Replaced damaged wet well gate stem and completed

repairs to the emergency generator. Routine operation and maintenance continued.

13. ELK CITY LAKE, KS

Location. On the Elk River at river mile 8.7, about 7 miles northwest of Independence, in Montgomery County, KS. (See Table Mound, KS, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 593 of the Annual Report for 1969. Construction began in February 1962, and the project was placed in useful operation in March 1966.

Local cooperation. Fully complied with.

Operations and results during fiscal year. Installed new septic system, electrical and water system for a new CXT toilet in Card Creek Park. Replaced low-flow butterfly valve and components in the gate control tower. Routine operation and maintenance continued.

14. FALL RIVER LAKE, KS

Location. On the Fall River at river mile 54.2, about 4 miles northwest of Fall River, in Greenwood County, KS. (See Severy, KS, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 953 of the Annual Report for 1969. Construction began in May 1946, and the project was placed in full operation in April 1949.

Local cooperation. Fully complied with.

Operations and results during fiscal year. Repaired the flood damaged low-water crossing on Badger Creek to allow access to the Whitehall Bay PUA and residential area. Completed chip and seal on Badger Creek Road. Routine operation and maintenance continued.

15. FORT SUPPLY LAKE, OK

Location. On Wolf Creek, a tributary of the North Canadian River, at river mile 5.5,

TULSA, OK, DISTRICT

about 12 miles northwest of Woodward, in Woodward County, OK. (See Fort Supply, OK, Geological Survey Map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 594 of the Annual Report for 1969. Construction began in October 1938, and the project was placed in full flood control operation in May 1942.

Local cooperation. Fully complied with.

Operations and results during fiscal year. Replaced actuators on both low flow valves and installed surge protection. Replaced siding on the project office. During the late May and early June flood event, project personnel were on 24-hour structure surveillance for approximately 2 weeks. Recovery from damage caused by the pool level rising seven foot above the top of the conservation pool continued thru the end of the FY. Routine operation and maintenance continued.

16. FRY CREEKS, BIXBY, OK

Location. In the northern part of the city of Bixby, in Tulsa County, OK.

Existing project. The project consists of enlarging both Fry Creeks, diverting Fry Creek 1 into Fry Creek 2 and then diverting the combined creeks into the Arkansas River. The total length of the modified channels would total 4.3 miles, with bottom widths of 30 to 225 feet and depths of 6 to 12 feet. Three bridges were replaced and 20 acres of land acquired for mitigation of fish and wildlife losses. Estimated total cost of the project is \$14,513,000.

Local Cooperation. The Project Cooperation Agreement was signed with the city of Bixby, OK, in January 1995.

Operations and results during fiscal year. Construction efforts were completed in FY00.

17. GREAT BEND, KS

Location. In Barton County, KS, on the north bank of the Arkansas River about 4.5 miles above its confluence with Walnut Creek. (See Great Bend, KS, Geological Survey map, scale 1:24,000.)

Existing project. The plan, authorized by the Flood Control Act of 1965, provides for 6.2 miles of leveed channel to divert Walnut Creek flood flow around Great Bend into the Arkansas River upstream from the city; a 1.5-mile leveed channel to divert Little Walnut Creek flood flow into the Walnut Creek diversion levees along the Arkansas River; a tie-back levee 4.3 miles long on the Arkansas River left bank upstream from the junction of the Walnut diversion channel; and appurtenant facilities.

Local cooperation. Fully complied with.

Operations and results during fiscal year. Financial closeout on this project was completed during FY 97. This project has been fully operational since June 1994. Estimated total cost of the project is \$36,350,000 (October 1994 price level base).

18. GREAT SALT PLAINS LAKE, OK

Location. On the Salt Fork of the Arkansas River at river mile 103.3, about 12 miles east of Cherokee, in Alfalfa County, OK. (See Jet, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 594 of the Annual Report for 1969. Construction of the project began in September 1938, and was completed in July 1941. The project was placed in full flood control operation in May 1941.

Local cooperation. Fully complied with.

Operations and results during fiscal year. Replaced the lighting along both sides of the spillway. Routine operation and maintenance continued.

19. HALSTEAD, KS

Location. In the city of Halstead, in Harvey County, KS, along the Arkansas River. (See Halstead, KS, Geological Survey Map, scale 1:24,000.)

Existing project. Provides for channel modification and construction of about 4

miles of levee in combination with straightening and widening approximately 3.6 miles of the Little Arkansas River channel to a 50-foot-bottom width in the vicinity of Halstead. Channel modification will be restricted to one side of the channel except in transition areas. Tree planting and re-vegetation will be done and ten pool riffle areas will be established to minimize environmental impacts.

Local cooperation. Fully complied with.

Operations and results during fiscal year. Routine operations and maintenance continued.

20. HEYBURN LAKE AND POLECAT CREEK, OK

Location. On Polecat Creek, a minor tributary of the Arkansas River, at river mile 48.6, about 11 miles west of Sapulpa, in Creek County, OK. (See Lake Heyburn, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 599 of the Annual Report for 1969. Construction started in March 1948, and the project was placed in useful operation in October 1950. Channel improvements below the lake were completed in September 1952.

Local cooperation. The channel improvement project below the lake was never maintained by the sponsor, Joint Drainage District No. 1, Tulsa and Creek Counties, OK. For this reason, the channel returned to its pre-project condition and does not provide flood protection for the affected area. The Corps of Engineers discontinued maintenance inspections of the channel project in 1982, due to the condition of the project and lack of cooperation on the part of the sponsor. Stakeholders have identified a need for a reallocation study.

Operations and results during fiscal year. Repaired erosion along right outlet channel wingwall. Routine operation and maintenance continued.

21. HUGO LAKE, OK

Location. On the Kiamichi River at river mile 17.6, about 7 miles east of Hugo, in Choctaw

County, OK. (See Hugo Dam, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 19-12 of the Annual Report for 1977. Construction began in October 1967, and the project was placed in useful operation in January 1974.

Local cooperation. Fully complied with.

Operations and results during fiscal year. WRDA 99 mandated the sale of approximately 250 acres of project lands at Hugo Lake to the Choctaw County Industrial Authority at fair market value. Tulsa District completed NEPA documentation, surveys and other activities needed for the land transfer. The Deed of Transfer was submitted and signed by the Secretary of the Army execution. Performed 24hr flood surveillance for 36 days, cleared debris and conducted flood recovery functions within project recreation areas. Replaced flood gate gear box casing (gate #2). Routine operation and maintenance continued.

22. HULAH LAKE, OK

Location. On the Caney River at river mile 96.2, about 15 miles northwest of Bartlesville, near Hulah, in Osage County, OK. (See Bowring, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 595 of the Annual Report for 1969. Construction began in May 1946, and was completed in June 1950. The project was placed in full flood control operation in September 1951.

Local cooperation. Fully complied with.

Operations and results during fiscal year. The reallocation study to identify water supply for the city of Bartlesville. The draft reallocation report and water storage contracts were forwarded to HQ for review in April 2006 and were approved in September 2007. Bartlesville postponed signing the water storage agreements associated with the reallocation until a Planning Assistance to States study to identify alternative sources of

TULSA, OK, DISTRICT

water supply was completed. The study was completed and a draft was forwarded to Bartlesville on December 31, 2007. The City will make a decision on the water supply after carefully considering all of its options. A decision by the city is expected in the spring of 2008. The review and approval process could take up to one year. During the late June and early July flood event, project personnel were on 24-hour structure surveillance for approximately 3 weeks. Recovery from damage caused by the pool level going above the top of the flood pool continued thru the end of the FY. Routine operation and maintenance continued.

23. JOHN REDMOND DAM AND RESERVOIR, KS

Location. The dam is located on the Grand (Neosho) River at river mile 343.7, about 2 miles northwest of Burlington, in Coffey County, KS. (See John Redmond Dam, KS, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 581 of the Annual Report for 1970. Construction was initiated in July 1959, and was completed in December 1965. The project was placed in flood control operation in July 1964.

Local cooperation. Fully complied with.

Operations and results during fiscal year. A reallocation study and associated environmental impacts have been conducted at John Redmond Reservoir to determine impacts of raising the top of the conservation pool elevation from 1039.9 feet NGVD to elevation 1041.0 feet NGVD. This action is being taken to make an equitable redistribution of the remaining storage due to uneven sediment deposition. Review comments have been received from HQUSACE. The local sponsor requested the action and is prepared to complete mitigation and replacement requirements due to this action. Response to comments should be completed by early spring. The District is in the process of working with the local sponsor to set up an escrow agreement to pay for the associated costs. Replaced 1.2 miles of boundary fence at the Hartford levee, procured a portable standby generator for operation of levee pump station; debris removal from the dam embankment; replaced flood

damaged CMP culverts in Riverside East Access Road; and demolished abandoned toilet vaults. Routine operation and maintenance continued.

24. KAW LAKE, OK

Location. On the Arkansas River at river mile 653.7, about 8 miles east of Ponca City, in Kay County, OK. (See Charley Creek West, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 19-13 of the Annual Report for 1977. Construction began in June 1966, and the project was placed in operation in May 1976.

Local cooperation. Fully complied with.

Operations and results during fiscal year. Replaced lower gallery sump pump and piping. During the late June and early July flood event, project personnel were on 24-hour structure surveillance for approximately 3 weeks. Recovery from damage caused by the pool level going above the top of the flood pool continued thru the end of the FY. Routine operation and maintenance continued.

25. LAKE KEMP, TX

Location. On the Wichita River at river mile 126.7, about 40 miles southwest of Wichita Falls, TX. (See Northeast Lake Kemp, TX, Geological Survey Map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 19-14 of the Annual Report for 1977. Construction began in May 1970, and the project was placed in useful operation in October 1972.

Local cooperation. Fully complied with. Stakeholders have identified a need for a reallocation study.

Operations and results during fiscal year. Customer funds have been provided and initial phases of the reallocation study are ongoing. Performed grouting operations to

downstream right embankment Routine
operation and maintenance continued.

26. LAKE WICHITA, HOLLIDAY CREEK, TX

Location. The project is located in Wichita and Archer Counties, TX. The Lake Wichita dam and the Holliday Creek channel are located in the city of Wichita Falls, TX. (See Wichita Falls, TX, Geological Survey Map, scale 1:24,000.)

Existing project. The existing Lake Wichita dam was replaced with an earthen dam approximately 16,000 feet long with a concrete spillway, an auxiliary spillway, and low-flow outlet works. Channel improvements along Holliday Creek from the new spillway to the Wichita River, a distance of 9.3 miles, were also constructed.

Local cooperation. Fully compiled with.

Operations and results during fiscal year. The project was completed October 1, 1996, and is fully operational. Estimated total project cost is \$48,789,000 (October 1995 price level base).

27. MARION RESERVOIR, KS

Location. On the Cottonwood River at river mile 126.7, about 3 miles northwest of Marion, in Marion County, KS. (See Pilson, KS, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 597 of the Annual Report for 1969. Construction began in June 1964, and the project was placed in flood control operation in February 1968.

Local cooperation. Fully complied with.

Operations and results during fiscal year. Replaced asphalt roof with a modified bitumen roof system on Project Office; replaced tainter gate hoist house doors and frames with a heavy gauge steel-ribbed door; and installed 2 prefabricated concrete odorless toilets in project recreational use areas. Routine operation and maintenance continued.

28. MCGRATH CREEK, WICHITA FALLS, TX

Location. The project is located in the northern central portion of Texas, in the city of Wichita Falls.

Existing project. McGrath Creek is approximately 3,900 feet long and connects Sikes Lake and the recently constructed Holliday Creek project. The project involves realigning and concrete lining the McGrath Creek Channel, and constructing a new spillway to pass flows through Sikes Lake.

Local cooperation. The city of Wichita Falls, TX, is the non-Federal sponsor. The Project Cooperation Agreement was executed in November 1994.

Operations and results during fiscal year. Project construction is completed. Estimated total project cost is \$14,500,000.

29. MINGO CREEK, OK

Location. On the right-bank tributary of Bird Creek in the city of Tulsa, in Tulsa County, OK. (See Tulsa, OK, Geological Survey Map, scale 1:24,000.)

Existing project. The project consists of 23 detention sites to capture peak flows and hold them temporarily until downstream flows subside. There are approximately 9.4 miles of channelization in selected locations on the tributaries and main stem of Mingo Creek. Estimated total project cost is \$123,960,725.

Local cooperation. The local sponsor is the city of Tulsa, OK, and has been fully complied with. The city has constructed 4.75 miles of channel and placed two excavated detention facilities into flood control operation prior to initiation of Federal construction in September 1988. Reimbursement for work completed by the city of Tulsa is \$19,000,000.

Operations and results during fiscal year. Construction efforts were complete in FY01.

30. OOLOGAH LAKE, OK

TULSA, OK, DISTRICT

Location. On the Verdigris River at river mile 90.2, about 2 miles southeast of Oologah, in Rogers County, OK. (See Oologah, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 19-15 of the Annual Report for 1972. Construction began in July 1950, but the project was placed in standby status in October 1951. Construction resumed in December 1955, and was completed in May 1963 for initial development. Construction for ultimate (second stage) development was initiated in July 1967, and was completed in 1974.

Local cooperation. Fully complied with.

Operations and results during fiscal year. During the late June and early July flood event, project personnel were on 24-hour structure surveillance for approximately 3 weeks. Recovery from damage caused by high flood pool continued thru the end of the FY. Routine operation and maintenance continued.

31. OPTIMA LAKE, OK

Location. On the North Canadian River at river mile 623.2, about 4.5 miles northeast of Hardesty, in Texas County, OK. (See Optima Dam, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the existing improvement, see page 19-16 of the Annual Report for 1979. Construction began in March 1966, and impoundment began in October 1978. Construction was completed in 1981.

Local cooperation. Fully complied with.

Operations and results during fiscal year. Routine operation and maintenance continued.

32. PARKER LAKE, OK

Location. On Muddy Boggy Creek, a tributary of the Red River, about 23 miles east of Ada, in Coal County, OK. (See Parker, OK, Geological Survey map, scale 1:24,000.)

Existing project. Parker Lake, if constructed, would be a multipurpose element in a plan of improvement for the Upper Muddy Boggy Creek Basin, OK. The project would consist of an earth fill dam about 2,200 feet long, a gated outlet works for flood control and water supply, and a 100-foot-wide spillway. The lake created would have a total storage capacity of 220,240 acre-feet and would yield 42 million gallons per day for municipal and industrial water supply. The project was authorized by WRDA of 1986, however the project has not been funded for construction. Federal accomplishment of single purpose municipal and industrial water supply projects is not a current Administration priorities.

Local cooperation. The Oklahoma Water Resources Board, the sponsor, has agreed to cost share in the flood control portion of the project and the water supply provided enough interested users for the water supply can be identified.

Operation and results during fiscal year. Estimated total project cost is \$71,400,000 (October 1992 price level base).

33. PAT MAYSE LAKE, TX

Location. On Sanders Creek, a tributary of the Red River, at river mile 4.6, about 12 miles north of Paris, in Lamar County, TX. (See Grant, TX, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 584 of the Annual Report for 1970. Construction began in March 1965, and the project was placed in full flood control operation in September 1967.

Local cooperation. The Water Resources Development Act of 2007 directed the Secretary to accept from the local sponsor, the city of Paris, Texas \$3,461,432 as payment in full of monies owed to the United States for water supply storage space in Pat Mayse Lake, including accrued interest. The local sponsor will still be responsible for its pro rata share of the joint-use operation and

maintenance costs and any repair, rehabilitation, and replacement costs.

Operations and results during fiscal year. Routine operation and maintenance continued.

34. PEARSON-SKUBITZ BIG HILL LAKE, KS

Location. On Big Hill Creek at river mile 33.3, about 4.5 miles east of Cherryvale, KS. (See Dennis, KS, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 19-11 of the Annual Report for 1983. Construction began in April 1974, and impoundment began in March 1981.

Local cooperation. Fully complied with.

Operations and results during fiscal year. Repaired flood damaged retaining wall at the overlook area; applied a bituminous chip/seal road seal on the project access road. Routine operation and maintenance continued.

35. PINE CREEK LAKE, OK

Location. On the Little River at river mile 145.3, about 5 miles northwest of Wright City, in McCurtain County, OK. (See Wright City, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 584 of the Annual Report for 1970. Construction began in February 1963, and the project was placed in useful operation in June 1969.

Local cooperation. Fully complied with.

Operations and results during fiscal year. Performed debris removal and flood recovery function within recreation areas. Routine operation and maintenance continued.

36. SARDIS LAKE, OK

Location. On Jackfork Creek, a tributary of the Kiamichi River, at river mile 2.8, about 2.5 miles north of Clayton, in Pushmataha County,

OK. (See Yanush, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 19-11 of the Annual Report for 1983. Sardis Lake is operated as a unit of a two-lake system for flood control in the Kiamichi River Basin. (The other lake in the system is Hugo Lake). Construction began in August 1975, and the project became operational in January 1983.

Local cooperation. The Oklahoma Water Resources Board (OWRB) failed to make satisfactory arrangements to pay for the Sardis Lake water supply storage as agreed to in a letter exchange of September 1997. On July 2, 1998, the state of Oklahoma was declared in default under the contract. On July 14, 1998, the Department of Justice (DOJ) filed suit in the Northern District Court of Oklahoma. The litigation has not moved forward because of a taxpayer "qui tam" (Fent case) suit filed in January 1998 in the Western District Court of Oklahoma against the OWRB and the United States. The suit between OWRB and the United States was postponed until a decision was reached on the taxpayer "qui tam" suit. On March 4, 1999, the Western District Court dismissed OWRB and the United States from the suit. The Fent case was appealed to the Tenth Circuit U.S. Court of Appeals. The dismissal was upheld and the case was remanded. The Fent case was appealed to the Oklahoma Supreme Court (OSC) and the OSC accepted the case for review. The qui tam lawsuit was settled when the OSC ruled that the water storage contract between the state of Oklahoma and the United States Government is a legally binding contract. Since that decision, the Federal government has re-opened its lawsuit and it is now in litigation in the U.S. District Court for the Northern District of Oklahoma. The United States filed a motion for summary judgment on December 14, 2003. The state of Oklahoma filed its response on January 23, 2004. The United States filed their Reply on February 20, 2004. On November 9, 2004, the United States filed a Memorandum of Law pursuant to the Order of the Court dated October 22, 2004. The Memorandum addressed issues related to the validity of the Sardis Lake contract No. DACW56-74-C-

TULSA, OK, DISTRICT

0134 under state law and the preemption of state law by Federal law. The state of Oklahoma was also directed to file a Memorandum of Law on these issues. On May 19, 2005, the Court entered an order granting the Summary Judgment Motion of the United States. The state of Oklahoma appealed to the U.S. Court of Appeals for the Tenth Circuit. Briefs have been filed by the state of Oklahoma and the United States. The U.S. Court of Appeals for the Tenth Circuit reviewed the briefs and issued an Order upholding the lower court's ruling. The state of Oklahoma filed a Petition for a Writ of Certiorari with the Supreme Court. The U.S. Supreme Court denied the Petition on January 8, 2007. The contract was declared to be valid and binding and may now be enforced by the U.S. Tulsa District is working with DOJ to collect the monies owed to the U.S. Work is ongoing.

Operations and results during fiscal year. Performed 24hr flood surveillance for 6 days, cleared debris and conducted flood recovery functions within project recreation areas. Routine operation and maintenance continued.

37. SKIATOOK LAKE, OK

Location. On Hominy Creek, a tributary of Bird Creek in the Verdigris River Basin, at river mile 14.3, about 5 miles west of Skiatook, in Osage County, OK. (See Avant S.E., OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see Page 19-8 of the Annual Report for 1987. Construction began in January 1974, impoundment began in October 1984, and the project became operational in November 1984.

Local cooperation. Fully complied with. Stakeholders have identified a need for a reallocation study.

Operations and results during fiscal year. Performed 24hr flood surveillance for 6 days, cleared debris and conducted flood recovery functions within project recreation areas. Routine operation and maintenance continued.

38. TORONTO LAKE, KS

Location. On the Verdigris River at river mile 271.5, about 4 miles southeast of Toronto, in Woodson County, KS. (See Fredonia, KS, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 600 of the Annual Report for 1969. Construction began in November 1954, and the project was placed in full operation in March 1960.

Local cooperation. Fully complied with.

Operations and results during fiscal year. WRDA 99 mandated the transfer, without consideration, of 31.98 acres of project lands to the state of Kansas for use as an Honor Camp. The state of Kansas must pay for the administration costs of the land transfer. A letter was sent to the state of Kansas informing the state of the administrative costs, however, the state is not interested in paying the costs and is not pursuing the land transfer. Removed trees and woody growth on dam abutments to prevent root intrusion. Routine operation and maintenance continued.

39. TULSA AND WEST TULSA LEVEES, OK

Location. On the banks of the Arkansas River near Tulsa, OK. On the left bank, the levee extends from river mile 531.0 near Sand Springs, OK, downstream to river mile 521.4 at Tulsa. On the right bank, the levee extends from near river mile 526.7 downstream to river mile 521.3 and is adjacent to the major portion of the business and residential districts in West Tulsa, Tulsa County, OK.

Existing project. The Tulsa and West Tulsa Levees were completed by the Tulsa District in 1945. The project was turned over to the Tulsa County Drainage District No. 12 for operations and maintenance. The project consists of 3 levees with a total length of about 20 miles and an average height of 10 feet. The levees provide protection from flooding to property valued at approximately \$1 billion dollars. Rehabilitation of the

drainage pipes thru the existing levee were completed in FY02.

Local cooperation. Fully complied with..

Operations and results during fiscal year. Routine operation and maintenance continued.

40. WAURIKA LAKE, OK

Location. On Beaver Creek, a tributary of the Red River, at river mile 27.0, about 6 miles northwest of Waurika, in Jefferson County, OK. (See Hastings, OK-TX, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 19-12 of the Annual Report for 1983. Waurika Lake is operated as a unit of a coordinated lake system for flood control in the Red River Basin. Construction began in July 1971, and impoundment began in August 1977.

Local cooperation. Fully complied with. The Water Resources Development Act of 2007 included language that set the remaining obligation of the Waurika Project Master Conservancy District payable to the United States in the amounts, rates of interest, and payment schedules that existed on June 3, 1986 and stipulated they could not be adjusted, altered, or changed without a specific, separate, and written agreement between both parties.

Operations and results during fiscal year. Completed stilling basin dewatering and inspection at Waurika Lake. Repaired erosion to downstream outlet due to high releases during the summer flood event. Performed 24 hr flood surveillance activities for 14 days. Performed 24 hr flood surveillance for 14 days. Debris removal and flood recovery function within recreation areas. Routine operations and maintenance continued.

41. WINFIELD, KS

Location. Winfield is located approximately 15 miles north of the Kansas-Oklahoma state line on U.S. Highway 77 in Cowley County, KS. The city is located immediately southeast of the confluence of the Walnut River and Timber Creek.

Existing project. The project consists of raising and extending approximately 4 miles of levee along Timber Creek and the Walnut River. Road ramps will be constructed at two locations where city streets cross the Walnut River.

Local cooperation. Fully complied with.

Operations and results during fiscal year. Routine operation and maintenance performed.

42. WISTER LAKE, OK

Location. On the Poteau River at river mile 60.9, about 2 miles south of Wister, in LeFlore County, OK. (See Wister, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 601 of the Annual Report for 1969. Construction began in April 1946, and was completed in May 1949. The project was placed in full flood control operation in October 1949.

Local cooperation. Fully complied with.

Operations and results during fiscal year. Performed maintenance work on the road system leading up to the project office, spillway and downstream areas of the structure. This provided road system that should be sustainable for many years. Additionally, gate hoist motors were cleaned, greased and painted as part of the continuing maintenance program on the structure. Routine operation and maintenance continued

43. OTHER AUTHORIZED FLOOD CONTROL PROJECTS

See Table 38-E.

44. INSPECTION OF COMPLETED LOCAL FLOOD PROTECTION PROJECTS

Inspections of completed, Federally constructed local flood protection projects

which are owned, operated, and maintained by local interests are made to determine the extent of compliance with approved regulations for operations and maintenance. The inspections assist the Corps of Engineers in determining if the project provides the flood protection for which it was constructed. See Table 38-I for a list of projects inspected in FY 06. Fiscal year cost was \$301,251.

45. SCHEDULING FLOOD CONTROL RESERVOIR OPERATIONS

The Tulsa District Corps of Engineers is responsible for flood control operations at 12 non-Corps projects. These include nine Bureau of Reclamation lakes, two Grand River Dam Authority lakes, and one city-county owned lake. All of these projects were constructed wholly or in part with Federal funds. Routine flood control releases were required at several of the projects. Fiscal year costs for scheduling flood control reservoir operations totaled \$1,084,388.

46. EMERGENCY RESPONSE ACTIVITIES - FLOOD CONTROL AND COASTAL EMERGENCIES

a. Disasters. The Emergency Operations Center (EOC) was activated for what proved to be a record setting number of times for the District, a total of 4 times during FY 07. The first of these was for the January Ice Storm in support of 2 FEMA Mission Assignments issued under 3272-EM-OK. The 2nd EOC operational period was to provide support for what eventually was a total of 8 FEMA Mission Assignments issued for execution in support of the Greensburg, KS Tornado and Flooding in KS under 1699-DR-KS. Those EOC operations were then extended for a 3rd time in mid-May due to PL-84-99 supported flood fighting in the Tulsa District southern KS area. The 4th EOC Operational period was from late June thru late August for PL 84-99 supported flood fighting across the entire District AOR and this operational period was extended to support another 8 FEMA Mission Assignments issued for Post-Flooding support under 1711-DR-KS.

These extended EOC operational periods continued at the end of the FY primarily in support of the on going FEMA mission

assignments as well as to support the initiation of 6 separate PL 84-99 Levee Rehabilitation projects from the May and July flooding which will continue into FY 08.

b. Operational Program Areas. Fiscal year cost for catastrophic disaster preparedness was \$17,669; \$-72,222 for anti-terrorism force protection; \$337,255 for disaster preparedness; \$276,238 for the emergency operations; and \$17,714 for the rehabilitation and inspection.

c. Emergency Work in Support of Other Federal Agencies. The Tulsa District Power PRT was called on for deployment in FY 07 for the January Ice Storm. In addition members of the PRT also participated in the USACE National Emergency Power Exercise conducted at Ft. Belvoir in May of 2007. Emergency Management Unit personnel also deployed in support of ESF #3 missions for the North Atlantic Division Nor'Easter Storm in April, the Greensburg 1699-DR-KS disaster in May, and supported virtually ongoing PL 84-99 Flood Damage Reduction Project Rehabilitation work in Sacramento District (CESPK). Approximately 30 other District employees deployed in support of various FEMA mission assignments received by the Tulsa District during the FY and another 20 in support of flood fight activities under PL 84-99.

47. FLOOD CONTROL WORK UNDER SPECIAL AUTHORIZATION

See Table 38-J for FY 06 expenditures for Small Flood Control Projects Not Specifically Authorized by Congress (Section 205); Emergency Streambank and Shoreline Projects (Section 14).

Multiple-Purpose Projects Including Power

48. BROKEN BOW LAKE, OK

Location. On the Mountain Fork River at river mile 20.3, about 9 miles northeast of Broken Bow, in McCurtain County, OK.

(See Broken Bow, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvements, see page 29-17 of the Annual Report for 1971. Construction began in November 1961, and the project was placed in useful operation in October 1969. Power units 1 and 2 were placed in operation in January and June 1970, respectively.

Local cooperation. The development of a trout fishery in the Mountain Fork River below Broken Bow Lake was implemented in 1989, in cooperation with the Corps of Engineers (Corps), Southwestern Power Administration, Oklahoma Department of Wildlife Conservation, and OWRB. The operation of the trout stream has been cooperatively managed by a Memorandum of Understanding. WRDA of 1996, Sec. 338, modified the project to provide for the reallocation of sufficient quantity of water supply storage space to support the Mountain Fork trout fishery at no expense to the state of Oklahoma. WRDA 1999 allowed for a 3-foot seasonal pool to offset losses to hydropower caused by the trout fishery. The study to determine the impacts of these actions identified 16 cultural resource sites that would be adversely impacted due to the 3-foot seasonal pool raise. The State Historic Preservation Office (SHPO) wanted every site mitigated, which would have cost about \$2.4M. After a trip to the project in October 2005 by Tulsa District and SHPO personnel, SHPO identified 8 sites it wants mitigated. Also, a Memorandum of Agreement will have to be developed between the two agencies outlining the resolution of the adverse effects on the sites which are eligible for listing in the National Register for Historic Places. The reallocation study cannot be completed until all cultural resource issues are worked out. Work is on-going.

Operations and results during fiscal year. Replaced anodes on two intake gates (64 anodes). Replaced phone system to match District system. Replaced CO2 bottles for fire protection. Replaced essential transformer for powerhouse controls. Asbestose removal contract. Routine operation and maintenance continued.

49. EUFAULA LAKE, OK

Location. On the Canadian River at river mile 27.0, about 12 miles east of Eufaula, in McIntosh County, OK. (See Porum, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 588 of the Annual Report for 1970. Construction began in December 1956, and the project was placed in full flood control operation in February 1964. There are numerous areas along the shoreline where private property is subject to flooding and erosion as a result of the construction and operation. Erosion problems in numerous subdivisions bordering the lake were studied in 1989 and 1993. At this time, it is estimated that there are approximately 22 miles of shoreline in need of attention. Estimated costs for repair is approximately \$15 million.

Local cooperation. Fully complied with. The Water Resources Development Act of 2007 recognizes recreation as a project purpose and directs the Secretary to establish an advisory committee for Lake Eufaula. The purpose of the committee is advisory only to provide information and recommendations regarding operations. The act also authorized a reallocation study subject to appropriation of funds to develop a recommendation concerning the best value while minimizing ecological damages for current and future use of storage capacity for the authorized project purposes and for the District to take into consideration recommendations for a pool management plan. Work to accomplish the provisions of this act will be ongoing.

Operations and results during fiscal year. A new gate house and entrance road have been constructed at Porum Landing Public Use Area, which will allow for better flow of traffic and a more efficient collection of use fees public. A lot of funds in FY 07 were used for the ice storm and flood clean up and maintenance. Removed damaged quarry tile from the powerhouse generator bay floor and replaced with a finished concrete. Repaired the parking area at the power plant. Insulated raw water piping. Replaced generator slip ring brushes with

TULSA, OK, DISTRICT

constant pressure brush rigging. Routine operation and maintenance continued.

50. FORT GIBSON LAKE, OK

Location. On the Grand (Neosho) River at river mile 7.7, about 5 miles north of Fort Gibson, in Muskogee County, OK. (See Fort Gibson Dam, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 604 of the Annual Report for 1969. Construction began in March 1942, but was held in abeyance during World War II. Construction resumed in May 1946, and was completed in June 1950. The fourth generator was installed and the project placed in full operation in September 1953.

Local cooperation. Fully complied with.

Operations and results during fiscal year. Installed 6,200 ft of barb wire fence along toe of Dike 10 to keep unauthorized vehicles from eroding embankment. Installed IP phone system at Lake Office. Replaced old floatation with new encapsulated float tubes under Government boat docks. Constructed waterfowl pond near Dike 1. Cleared boundary line and installed approximately 3000 feet of barb wire fence to delineate boundary line and prevent encroachments near Wagoner. Installed six new CXT RR's in each of the following Public Use Area's (PUA's): Wahoo, Wildwood, Rocky Point, Taylor Ferry North, Taylor Ferry Beach and Flatrock. Installed new courtesy dock at Taylor Ferry South. Removed significant ice storm and flood debris from all PUA's and re-opened for use by the public. Disposed of two old MVT's, two masonry change houses and five CMT's and removed from real property. Installed Life Jacket Loaner board and canopies at Taylor Ferry Beach. Rebuilt one of the station unwatering pumps. Replaced Coupling Capacitor Voltage Transformers and disposed of PCB contaminated items. Rebuilt several headers on the generator cooling water boxes. Purchased metal oxide varistors for installation on generator 15 KV bus. Replaced clapper valve floats in governor pressure tanks. Routine operation and maintenance continued.

51. KEYSTONE LAKE, OK

Location. On the Arkansas River at river mile 538.8, near Sand Springs, OK, and about 15 miles west of Tulsa, OK. (See Keystone Dam, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 589 of the Annual Report for 1970. Construction began in January 1957, and the project was placed in flood control operation in September 1964.

Local cooperation. Fully complied with.

Operations and results during fiscal year. A dam safety study was initiated in response to an inspection which revealed a seep in both abutments. The study will also address the potential need to add a cut-off trench at the downstream side of the embankment. Replaced rip rap on right, upstream abutment to dam embankment. Repaired access roadway to dam bulkhead storage/maintenance area on left, upstream side of dam. Replaced overhead power lines at pump station #1, replaced gravel at all four parking lots/access roads to pump stations, and continued work in clearing woody vegetation growth along upstream toe at the Cleveland Levee. During the late June and early July flood event, project personnel were on 24-hour structure surveillance for approximately three weeks. Recovery from damage caused by the pool level going above the top of the flood pool continued thru the end of the FY and into FY 08. Purchased rubber seals and epoxy paint for repair of turbines. Replace sluice gate ball valves. Routine operation and maintenance continued.

52. LAKE TEXOMA (DENISON DAM), OK AND TX

Location. On the Red River at river mile 725.9, about 5 miles northwest of Denison, TX. (See Denison Dam, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 603 of the Annual Report for 1969. Lake Texoma is operated as a unit of a coordinated lake system for flood control in the Red River

Basin. Construction started in August 1939, and was completed in February 1944. Commercial power generation was started in March 1945. Authorized work is complete except for installation of the third, fourth, and fifth power units.

Local cooperation. Fully complied with.

Operations and results during fiscal year. WRDA 99 mandated the sale, at fair market value, of approximately 1,580 acres of project lands to the state of Oklahoma. The administrative costs of the land transfer must be paid by the state of Oklahoma. An estimate of administrative costs, \$187,000, was provided by Oklahoma Commissioners. Transfer of \pm 525 acres completed. A study to reallocate an additional 105,000 acre-feet of storage from hydropower to water supply is underway and a draft reallocation report and Final Environmental Assessment was forwarded to HQUSACE for review in the May 2007. Review comments were received around the 1st of December 2007. Comments will be addressed and an Issue Resolution Conference (IRC) will be required to work out issues with stakeholders. Work is ongoing. Repaired of flood gate cables emergency. Replacement of cables on two flood gates. Rehab of intake powerhouse gate. Performed 24 hr surveillance for 41 days. The 3rd highest pool elevation during 63 year project life span. Painted emergency flood gate. Repair of downstream relief well system. Debris removal and flood recovery functions within recreation areas. Routine operation and maintenance continued.

53. ROBERT S. KERR LOCK AND DAM AND RESERVOIR, OK

Location. On the Arkansas River at navigation mile 336.2, about 8 miles south of Sallisaw, in LeFlore County, OK. (See Robert S. Kerr, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 19-21 of the Annual Report for 1972. The Robert S. Kerr Lock and Dam and Reservoir is a unit of the McClellan-Kerr Arkansas River Navigation System. Construction began in April 1964, and closure was completed in October 1970. The lock and dam became operational for navigation

in December 1970. Generating units 1, 2, 3, and 4 were placed in operation in October, July, September, and November 1971, respectively.

Local cooperation. See section 1 of this report.

Terminal facilities. Five sites have been developed for handling coal, grain, construction aggregates, and miscellaneous cargo. The facilities are considered adequate for present traffic.

Operations and results during fiscal year. Procured station service air compressors. Purchased motors for unwatering pumps. Replace phone system to match District system. Four new boat ramps had an approach lane added and paved, a playground was constructed in Short Mountain, and a sewage lagoon was built for the trailer dump station in Cowlington. Routine operation and maintenance continued.

54. TENKILLER FERRY LAKE, OK

Location. On the Illinois River at river mile 12.8, 7 miles northeast of Gore, in Sequoyah County, OK. (See Gore, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 606 of the Annual Report for 1969. Construction began in June 1947, and was completed in July 1953.

Local cooperation. Fully complied with. Stakeholders have identified a need for a reallocation study.

Operations and results during fiscal year. A project to build an auxiliary spillway and to modify the existing spillway was authorized February 22, 1994, by the Acting Assistant Secretary of the Army, under the Dam Safety Assurance Program. Phase I was awarded in FY 00. Phase II was awarded in FY 04 and completed in FY 07.. The auxiliary spillway project was completed except for completion of some grouting and bridge deck repairs which are underway and scheduled for completion in FY 08.

TULSA, OK, DISTRICT

Replaced obsolete phone system with VOIP system. Completed replacement of roofs on six picnic shelters. Completed construction of two new courtesy docks at Sizemore and Chicken Creek South, Completed construction of new fee station at Elk Creek, Completed replacement of CMP toilets at Chicken Creek South with two CXT vault toilets. Continued replacement of doors and windows of restroom buildings at various parks. Removed and trimmed dead and hazardous trees and limbs. Old patrol boat was replaced. Painted the surge tank for the power penstock. Replaced surge arrestors on the generator 15 kv bus. Customer funding was used to replace cooling fans. Routine operation and maintenance continued.

55. WEBBERS FALLS LOCK AND DAM, OK

Location. On the Arkansas River at navigation mile 366.6, about 5 miles northwest of Webbers Falls, in Muskogee County, OK. (See Webbers Falls, OK, Geological Survey map, scale 1:24,000.)

Existing project. For a description of the completed improvement, see page 19-23 of the Annual Report for 1977. The Webbers Falls Lock and Dam is a unit of the McClellan-Kerr Arkansas River Navigation System. In January 1965, construction began and the project was placed in useful operation in November 1970. The lock and dam became operational for navigation in December 1970. Generating units 1, 2, and 3 were placed in operation in August, September, and November 1973, respectively.

Local cooperation. See section 1 of this report.

Terminal facilities. Facilities at the Port of Muskogee include: a cargo pier, mooring dolphins, warehouse, terminal building, and fuel facility built by the Muskogee City-County Port Authority; a liquid cargo loading facility and a steel unloading facility built by Frontier Steel Company; grain holding facilities built by Conagra, Inc.; and a general-purpose private dock built by the Fort Howard Paper Company. The facilities are considered adequate for present traffic.

Operations and results during fiscal year. Customer funds were used to provide cooling

H2O piping at the project. Replace phone system to match District system. Installation of fiber optic. Installed new trash racks and clammed debris in Powehouse intakes. Completed replacement of faulty electrical wiring to sites in Spaniard Creek. Replaced water hydrants and valves on one loop at Brewers Bend. Installed one replacement CXT vault toilet at Spaniard Creek. Completed construction of fee stations in Brewers Bend and Chicken Creek. Completed clean up of dead trees and hazardous limbs that resulted from January 2007 ice storm. Completed replacement of windows at Spaniard Creek and Brewers Bend. Routine operation and maintenance dredging was performed at various locations on the system (MKARNS-to include Webbers Falls locations) to remove shoaling from the 2007 Flood Event. Routine operation and maintenance continued.

Environmental Infrastructure

56. LAWTON, OK

Location. Lawton is located approximately 80 miles southwest of Oklahoma City on Highway 44.

Existing project. The project consists of demolition of an existing, but abandoned, wastewater treatment facility.

Local cooperation. Cost sharing on this project will be 75% Federal and 25% non-Federal. The city will be responsible for provision of LERRD and cash as necessary.

Operations and results during fiscal year. In FY04, this project design was initiated. The letter report for the project was approved. NEPA approval process is underway.

57. TAR CREEK CLEANUP, OK

Location. Tar Creek is located in northeast Oklahoma, in Ottawa County.

Existing project. The project consists of technical planning, design and construction assistance to non-Federal interests to remedy adverse environmental and human health

impacts. Projects demonstrate practicable alternatives and activities which include measures to address lead exposure and other environmental problems related to historical mining activities in the area. Projects include capping of areas where surface materials containing high levels of lead are easily wind-dispersed in local communities, plugging of open mineshafts, and a subsidence potential evaluation.

Local cooperation. Cooperating non-federal interests are responsible for LERRD.

Operations and results during fiscal year. In FY05, establishment of a grass cover was completed on the Boys and Girls Club Project in Picher, OK, and open mineshafts were plugged. The draft subsidence evaluation was completed, and additional mine shaft planning work began.

58. YUKON, OK

Location. Yukon is located immediately adjacent to Oklahoma City's western boundary on Highway 66.

Existing project. The project consists of constructing approximately 9 miles of domestic water line connecting the city's well field to the city water system. Also to be constructed is a one million gallon storage facility.

Local cooperation. Cost sharing on this project will be 75% Federal and 25% non-Federal. The city will be responsible for provision of LERRD and cash as necessary.

Operations and results during fiscal year. In FY04, this project was scoped and design undertaken. The project letter report was approved. NEPA approval process is underway.

General Investigations

59. SURVEYS

Fiscal year cost was \$704,362, which included five special studies, one watershed comprehensive study; miscellaneous activities - special investigations, and Interagency Water Resources Development; North American Waterfowl Management Plan, Coordination with

other Agencies, and two planning assistance to states studies. Table 38-K provides a specific list and respective fiscal year expenditures.

60. COLLECTION AND STUDY OF BASIC DATA

Fiscal year cost was \$207,605, which includes floodplain management services. Table 38-K provides a specific list and respective fiscal year expenditures.

Navigation

1. TRINITY RIVER PROJECT, TX

The project authorized by the River and Harbor Act of 1965 (H. Doc 276, 89th Cong., 1st Sess.) consists of five major components: Multiple-Purpose Channel, Tennessee Colony Lake, Dallas Floodway Extension, West Fork Floodway and Water Conveyance Facilities. For the last full report on the project as authorized, see Annual Report of 1978. The project information present herein is based on the tentatively selected project plan presented in the Draft General Design Memorandum. The plan consists of three structural components: Dallas Floodway Extension, Tennessee Colony Lake, and Channel to Liberty in the lower basin.

Operations during fiscal year. See Galveston, Texas, District Annual Report for Channel to Liberty. Tennessee Colony Lake has been dormant for several years due to lack of local support, and is proposed for deauthorization. The Dallas Floodway Extension continues in the construction phase, and is described in the Flood Control section.

CHANNEL TO LIBERTY:

Location. The Channel to Liberty begins at the Houston Ship Channel, crosses the bay area in an easterly direction to intersect the existing Double Bayou Channel, turns northward along the coastline to Wallisville Lake and then continues northward through the lake area along the course of the Trinity River to River Mile 45 above Liberty, Texas.

Existing project. See Galveston, Texas District Annual Report for existing project.

Proposed project. The navigation portion of the channel will have a width of 200 feet with a depth of 12 feet and will extend from the Houston Ship Channel in Galveston Bay to the port of Liberty, Texas. The flood control portion of the channel will have a bottom width of 200 feet with a depth of 30 feet, and will extend from Wallisville Lake to River Mile 45 above Liberty, Texas.

Local cooperation. Local interests are required to: (a) provide, without cost to the Federal Government, all lands, easements and rights-of-way required for construction, operation and maintenance of the project, (b) accomplish, without cost to the Federal Government, all relocations and alterations to existing improvements, other than highway bridges over new land cuts and railroad bridges required for the construction of the project, (c) maintain and operate the flood control portion of the channel upstream of Liberty, Texas, and (d) reimburse the Federal Government for one-half of the separable costs allocated to recreation and fish and wildlife enhancement.

TENNESSEE COLONY LAKE:

Location. The Tennessee Colony dam site is located at River Mile 341.7 on the Trinity River about 22 miles west of Palestine, Texas. The lake would extend into Freestone, Anderson, Henderson, and Navarro Counties, and would control a drainage area of 12,302 square miles.

Existing project. The plan of improvement provides for the construction of an earthfilled dam with a maximum height of 123 feet above the streambed and a total embankment length of 42,350 feet with a gated concrete spillway. The lake will have a total controlled storage of 3,455,000 acre-feet and a water surface area of 114,400 acres at the top of the flood control pool and 68,100 acres at the top of the conservation pool. The total storage includes 2,269,500 acre-feet for flood control, 1,040,000 acre-feet for conservation, and 145,500 acre-feet for sediment reserve. The project will be proposed for deauthorization in the next Water Resources Development Act.

Local cooperation. Local interests are required to reimburse the Federal Government for costs allocated to water supply storage and one-half of the separable cost allocated to recreation and fish and wildlife enhancement.

Flood Control

2. AQUILLA LAKE, TX

Location. On Aquilla Creek in Hill County, Texas, with the dam at River Mile 23.3, about 6.8 miles southwest of Hillsboro, Texas, and about 24.0 miles north of Waco, Texas.

Existing project. For description of completed improvements and authorizing acts see Annual Report of 1984. Construction was started March 1977, and project was ready for beneficial use April 29, 1983. Estimated cost of project is \$45,503,300.

Local cooperation. The Water Supply Act of 1958, as amended, and the Federal Water Project Recreation Act of 1965 and Section 221, Flood Control Act of 1970 apply. A contract with the Brazos River Authority for water supply storage was approved by the Secretary of the Army, June 29, 1976. To date, the Authority has paid \$1,721,281

toward principal and \$612,892 to operation and maintenance.

Operations during fiscal year. Installed deep benchmark on dam, replaced office roof, installed fall protection in structure, patched road cracking on dam, and cleared major brush from toe of dam. Continued routine operations and maintenance activities.

Benefits accrued to Aquilla Lake project: Accumulated flood damages prevented through FY 2007 were \$41,176,100.

3. BARDWELL LAKE, TX.

Location. Dam is on Waxahachie Creek 5-river miles upstream from its confluence with Chambers Creek, a tributary of the Trinity River, and about 5 miles south of Ennis, Ellis County, Texas.

Existing project For a description of completed improvement and authorizing act see Annual Report of 1969. Construction of project was started August 1963 and completed for beneficial use in November 1965. Estimated cost of project is \$10,944,505.

Local cooperation. Local interests must reimburse the Federal Government for costs allocated to increased water supply storage under the terms of the Water Supply Act of 1958. A contract was approved by the Secretary of the Army on June 24, 1963, and the Trinity River Authority, a State agency, agreed to fulfill all requirements of local cooperation. To date the authority has paid \$2,736,816 toward principal and \$4,181,332 toward annual cost of operation and maintenance of project, including cost of operating 10-foot conduit.

Operations during fiscal year. Constructed group shelter with parking area in Highview Park. Upgraded 10 campsites to 50 amp electrical service. Installed 25KV emergency generator for the project office to provide for continuity of operations. Continued routine operations and maintenance activities. During the 2007 flood, Bardwell Lake was 18 feet above the conservation pool. The flooding caused damage to embankment, park roads and recreation facilities.

Benefits accrued to Bardwell Lake project: Accumulated flood damages prevented through FY 2007 were \$43,581,300.

4. BELTON LAKE, TX

Location. Dam is on Leon River about 16.7 miles above confluence of Leon and Lampasas Rivers and about 3 miles north of Belton, Texas.

Existing project. For a description of completed improvement and authorizing acts see Annual Report of 1962. Construction started June 1949 and project was ready for beneficial use in March 1954. Raising water supply pool: Construction started in July 1970 and the pool raise is complete. Estimated cost of project is \$16,960,549.

Local cooperation. Section 2, Flood Control Act of 1938, applies. A contract with Brazos River Authority, a State agency, for remaining water supply storage in reservoir was approved by Secretary of the Army on January 15, 1958, at an estimated cost of \$5,125,003. To date \$2,594,620 has been paid. Under the contract Brazos River Authority must also pay annually 11.2 percent of actual annual cost of operation and maintenance. To date \$4,933,140 has been paid. An interim contract with Brazos River Authority for emergency use of water supply storage in project was approved by Secretary of the Army on January 2, 1957. Amount of \$433,083 paid by authority on March 21, 1957 for use of these facilities was credited to interest and principal payable under formal water supply contract.

Operations during fiscal year. Repaired outlet works roof, replaced steel cable on overhead crane at outlet works. Continued successful volunteer program and strong water safety outreach program. Continued routine operations and maintenance activities. During the 2007 flood, Belton Lake was 35.47 feet above the conservation pool. The flooding caused instability to riprap along outlet works discharge channel and damage to park roads and recreation facilities. Belton Lake facilities were 90 percent inundated by flood waters.

Benefits accrued to Belton Lake project: Accumulated flood damages prevented through FY 2007 were \$746,657,200.

5. BENBROOK LAKE, TX

Location. Dam is in Tarrant County, Texas, on Clear Fork of Trinity River 15 river miles upstream from its confluence with West Fork of Trinity River about 10 miles southwest of downtown Fort Worth, Texas.

Existing project. For description of completed improvement and authorizing acts see Annual Report of 1962. Construction of project was started May 1947 and ready for beneficial use in September 1952. Estimated cost of project is \$13,130,463.

Local cooperation. Section 2, Flood Control Act of 1938, applies. No water supply storage is included in project. In 1956, Congress passed legislation enabling the city of Fort Worth to purchase conservation storage space in Benbrook Lake. Contracts have been negotiated with the city of Fort Worth and the Benbrook Water and Sewer Authority for the use of portions of the navigation storage for water supply purposes until such storage is required for Trinity River Navigation. To date, \$2,408,821 has been paid by the city of Fort Worth and \$316,446 by Benbrook Water and Sewer Authority. A cost-sharing contract with the city of Benbrook for Recreation Development was approved by the Secretary of the Army May 20, 1977. To date, \$27,315 has been paid.

Operations during fiscal year. Converted North Holiday Park to a fee park in order to provide enhanced control and security. Constructed an entrance complex with fee building, gate attendant sites and road improvements. Removed lead and repainted service bridge to the outlet works. Continued routine operations and maintenance activities. During the 2007 flood, Benbrook Lake was 16 feet above the conservation pool. The flooding caused damage to park roads and recreation facilities.

Benefits accrued to system consisting of Benbrook Lake, Clear Fork and West Fork Floodways: Accumulated flood damages prevented through FY 2007 are estimated at \$6,560,731,300.

6. CANYON LAKE, TX

Location. Dam is on Guadalupe River, 303 miles above its mouth, and about 12 miles northwest of New Braunfels, Comal County, Texas.

Existing project. For a description of completed improvement and authorizing act see Annual Report of 1969. Construction started April 1958 and project completed for beneficial use June 1964. Estimated cost of project is \$19,088,524, including \$1,400,000 contributed by local interests.

Hydropower: The Guadalupe-Blanco River Authority (GBRA) was licensed by the Federal Energy Regulatory Commission to construct a 6,070-kilowatt plant, which is located adjacent to the existing outlet channel. The project operates utilizing conservation releases, i.e., no change from the present operating regimen is anticipated. GBRA has an agreement with the Pedernales Electric Cooperative for sale of power. Construction of the hydropower was completed in 1989 with non-Federal funds.

Local cooperation. Local interests (Guadalupe Blanco River Authority) will utilize water impounded for water supply and streamflow regulation for development of electric power. In a formal contract approved by Chief of Engineers on October 24, 1957, Guadalupe-Blanco River Authority agreed to fulfill all requirements of local cooperation. Required contribution of \$1,400,000 was made in full by Guadalupe-Blanco River Authority. The estimated cost of the water storage contract is about \$9,000,000. To date, \$4,574,829 has been paid. In addition \$22,848 was contributed for installation and operation of reservoir leakage gages. Under the contract the authority must pay 34.8 percent of actual annual cost of operation and maintenance. To date, \$4,771,494 has been paid.

Operations during fiscal year. Completed repairs to emergency spillway and stilling basin. Continued successful volunteer program and strong water safety outreach program. Continued routine operations and maintenance activities. During the 2007 flood, Canyon Lake was 13.53 feet above the conservation pool. The flooding caused damage to park roads and deposited debris in the park.

Benefits accrued to Canyon Lake project: Accumulated flood damages prevented through FY 2007 were \$599,985,200.

7. CENTRAL CITY, FORT WORTH, UPPER TRINITY RIVER BASIN

Location. The Central City project is located in the northern portion of downtown Fort Worth, Texas, along the Clear Fork and West Fork of the Trinity River.

Existing Project. The Central City project, as part of a larger Trinity River Vision project, was authorized based on a locally produced Master Plan and was subject to determination of technical sufficiency and environmental acceptability. The Corps of Engineers' component of the Central City project includes a bypass channel and appurtenant structures to control flood flows along the Clear Fork and West Fork of the Trinity River. The project would restore the Standard Project Flood level of protection for the Federally authorized Fort Worth Floodway project. Preconstruction, Engineering and Design was initiated in FY 2006, and construction will begin at signing of the Project Cooperation Agreement. The authorized project cost is

\$220,000,000, of which \$110,000,000 is Federally funded, and \$110,000,000 is funded by the non-Federal sponsor.

Local cooperation. The non-Federal sponsor is the Tarrant Regional Water District.

Operations during fiscal year. FY 2007 expenditures for this project were \$3,546,505. Federal funds were used to initiate preliminary design analyses for the bypass channel, Samuels Dam, Marine Creek, and three closure gates, and finalize hydraulic mitigation sites.

8. DALLAS FLOODWAY EXTENSION

Location. The Dallas Floodway Extension is in the metropolitan city of Dallas, Dallas County, Texas, along the Trinity River.

Existing Project. The project consists of a 3.7 mile long Chain of Wetlands with an average width of 600 feet, with the alignment being placed on the west Trinity River overbank; and Standard Project levee of protection levees protecting the Lamar Street, Rochester Park, and the Cadillac Heights area; a levee providing 500 year level of protection to the Central Waste Water Treatment Plant, plus 31 miles of linear recreation. During flooding, the upper and lower wetlands would convey floodwaters to outfalls east of IH-45 and north of Loop 12, respectively. Additionally, the wetlands would provide 123 acres of ecosystem restoration. The River and Harbor Act of 1965 authorized the flood control portion of the project. Credits for flood protection works constructed by the non-Federal interest were authorized by the Water Resources Development Act of 1996, Section 351, where the Secretary of the Army determined that such work was compatible with the project and was required for its construction. Construction was initiated in FY 2005. Estimated Federal cost of this project is \$107,460,000 (October 2006 price levels), and estimated cost to local interests is \$51,441,000, a total cost for the project of \$158,901,000.

Local cooperation. On May 2, 1996, the citizens passed a bond election to pay for the non-Federal portion of the project. The Project Cooperation Agreement was signed by the city of Dallas in December 2001.

Operations during fiscal year. FY 2006 expenditures for this project were \$20,894,551. Funds were used to continue construction, plans and specifications development and reimburse the city of Dallas. The project is 25 percent complete, and is scheduled for completion in September 2015.

9. FERRELLS BRIDGE DAM - LAKE

O' THE PINES, TX

Location. Dam is on Cypress Creek in Marion, Harrison, Upshur, Morris, Camp, and Titus Counties, Texas, 8 miles west of Jefferson, Texas.

Existing project. An earthfill dam 10,600 feet long and 77 feet high includes a 200-foot spillway with a capacity of 68,200 cubic feet per second. Reservoir controls runoff from 850 square miles of drainage area, and has a gross storage capacity of 842,100 acre-feet including 587,200 acre-feet flood control storage, 3,800 acre-feet conservation storage, and 251,000 acre-feet for municipal and industrial water supply. Reservoir extends 28 miles upstream. Project affords substantial flood protection of Cypress Creek Valley from dam site to confluence with Red River and, together with operation of other reservoirs proposed in Red River Basin, will provide flood protection along main stem of Red River below Denison Dam. Construction commenced in January 1955 and was completed June 1960. Estimated Federal cost of project is \$19,215,008, including \$1,775,990 for Code 711 and \$399,739 accelerated Public Works fund. This project transferred to the Fort Worth District as of the end of FY 1979.

Local cooperation. None required.

Operations during fiscal year. Executed contract for upgrading electrical wiring and controls on gates. Upgrades were completed to 22 RV sites to include construction of concrete RV pads, 50 amp electrical service, concrete table pads with aluminum tables, fire rings, lantern poles and paving of circulation roads. Installed ceramic tile in two restrooms in Johnson Creek campground. Installed central heat and air units in seven restrooms in four of the campgrounds. Volunteer host sites were constructed in Brushy Creek and Johnson Creek campgrounds. Continued successful volunteer program. Continued routine operations and maintenance activities. During the 2007 flood, Ferrells Bridge Dam-Lake O' the Pines was 4.12 feet above the conservation pool. The flooding caused damage to park roads and recreation facilities.

Benefits accrued to Ferrells Bridge Dam-Lake O' The Pines project: Accumulated flood damages prevented through FY 2007 were \$63,531,800.

10. GRAHAM, TX (BRAZOS RIVER

BASIN)

Location. The project is located in the north central Texas city of Graham, in Young County, along Salt Creek, a tributary of the Brazos River.

Existing project. The Graham project consists of a buy-out of 113 structures, mostly residential; creation of a local trail system connecting two existing park areas for recreation; installation of a flood warning system estimated to provide a 12-hour warning time; and, ecosystem restoration of 129 acres. Project construction was initiated in FY 2005. The estimated cost of the project is \$13,230,000, with a Federal cost of \$8,426,000 and a non-Federal cost of \$4,804,000.

Local Cooperation. The Brazos River Authority is the non-Federal sponsor. The Project Cooperation Agreement was executed on 24 October 1999.

Operations during fiscal year. FY 2007 expenditures for this project were \$405,277. Federal funds were used to continue acquisition and demolition activities required for the project. The Brazos River Authority has provided funding for the Corps to conduct real estate acquisition to satisfy the non-Federal share of the project.

11. GRAPEVINE LAKE, TX

Location. Dam is in Tarrant County, Texas, on Denton Creek, 11.7 river miles upstream from its confluence with Elm Fork of Trinity River and about 20 miles northwest of city of Dallas, Texas.

Existing project. For description of completed improvement and authorizing act, see Annual Report of 1962. Construction of project was started December 1947 and ready for beneficial use in July 1952. Estimated cost of project is \$21,312,792, including \$2,040,000 contributed by local interests. A contract for modification of Embankment and Spillway was awarded September 30, 1983 and completed Fiscal Year 1990. The improvements provided for spillway modification by construction of spillway chute and stilling basin and a berm on the downstream side of the main embankment.

Local cooperation. A contract with Dallas County Park Cities Water Control and Improvement District No. 2 for 50,000 acre-feet of water supply storage was approved by Secretary of the Army on March 21, 1955. Park Cities paid the required \$607,000. A contract with city of Dallas for 85,000 acre-feet of water supply storage was approved by Secretary of the Army on March 17, 1954. Dallas paid the required \$1,433,026. A contract with city of Grapevine, Texas, for 1,250 acre-feet of water supply storage was

approved by Secretary of the Army on September 14, 1953, at an estimated cost of \$22,654. A contract for Interim Use of Navigation Storage with city of Grapevine was approved by Secretary of the Army on February 27, 1981, at an estimated cost of \$684,000, has been paid in full. Above contracts include payment of operation and maintenance costs as follows: Dallas County Park Cities Water Control and Improvement District No. 2, a pro rata part of the actual annual cost, which part is to be not less than \$2,000 nor more than \$3,000; Dallas, 9.2 percent of actual annual cost; and Grapevine, its pro rata part of actual annual cost (estimated at \$79.55 annually and included in total annual payment). Following operation and maintenance payments have been made: Park Cities, \$163,231; Dallas, \$1,327,136; and Grapevine, \$808,819.

Operations during fiscal year. Executed contract for upgrading electrical wiring and controls on gates. Repaired embankment slide. Continued routine operations and maintenance activities. During the 2007 flood, Grapevine Lake was 20.13 feet above the conservation pool. The flooding caused shoreline erosion and damage to park facilities and roads.

Benefits accrued to system comprised of Grapevine Lake and Dallas Floodway: Accumulated flood damages prevented through FY 2007 were \$11,477,543,700.

12. HORDS CREEK LAKE, TX

Location. On Hords Creek, a tributary of Pecan Bayou, about 13.5 miles west of Coleman, Texas, and about 27.8 miles upstream from mouth of Hords Creek.

Existing project. For description of completed improvement and authorizing acts see Annual Report of 1962. Construction of project was started January 1947 and completed for beneficial use in April 1948. Estimated cost of project is \$2,709,089 including \$105,000 contributed by local interests.

Local cooperation. Completed as required.

Operations during fiscal year. Upgraded 20 campsites to 50 amp electric service. Continued successful volunteer program and strong water safety

outreach program. Continued routine operations and maintenance activities.

Benefits accrued to Hords Creek project: Accumulated flood damages prevented through FY 2007 were \$1,068,800.

13. JIM CHAPMAN LAKE, TX

Location. Jim Chapman Lake is located in northeast Texas about 4 miles southeast of Cooper, 13.0 miles north of Sulphur Springs, and is at river mile 23.3 on the South Sulphur River. The South Sulphur River rises in Fannin County, Texas, and flows generally east for about 80 miles to its confluence with the North Sulphur River to form the Sulphur River.

Existing project. For description of completed improvement and authorizing acts, see Annual Report of 1997. Construction of project was started in July 1958 and completed for beneficial use in May 1994. The Energy and Water Development Appropriations Act of 1997, Public Law 104-206, H.R. 3816, 104th Congress, H.R. 3816, effective September 30, 1996, changed the name of Cooper Lake and Channels, TX, to Jim Chapman Lake, TX. Estimated cost of project is \$138,682,089, including \$227,000 non-Federal cost for land for the levees.

Local cooperation. Local interests (North Texas Municipal Water District, Sulphur River Municipal Water District, city of Irving) will utilize water impounded for present and future water supply. The total cost allocated to water supply to be reimbursed is \$54,600,000. North Texas Municipal Water District, NTMWD, has contracted for 36.859 percent of the water supply storage for future use with deferred payments for ten years. To date, \$547,914 has been paid. Under the contract NTMWD must pay 13.803 percent of actual annual cost of operation and maintenance. To date, \$669,465 has been paid. Sulphur River Municipal Water District, SRMWD, has contracted for 6.5 percent of the water supply storage for initial use and 19.78 percent for future use for a total of 26.282 percent of the water supply storage. To date, \$904,593 has been paid. Under the contract, SRMWD must pay 2.435 percent of actual annual operation and maintenance. To date, \$537,493 has been paid. The city of Irving has contracted for 16.923 percent of the water supply storage for initial use and 19.936 for future use for a total of 36.859 of the water supply storage. To date, \$1,817,284 has been paid. Under the contract Irving must pay 6.337 percent of actual annual operation and maintenance. To date \$808,494 has been paid.

The Texas Parks and Wildlife Department and the Corps of Engineers entered into or agreed to formal Operation and Maintenance contracts for recreation facilities and wildlife

conservation and management. Under the contracts for recreation facilities dated 7 November 1988 and 11 September 1990, Texas Parks and Wildlife is responsible for 100 percent of the operations and maintenance of two state parks constructed with Federal funds. Under the contracts for wildlife conservation and management the state is responsible for 24.14 percent of the operation, maintenance and replacement annual costs for areas totaling approximately 35,500 acres. The remaining balance is the responsibility of the Project Sponsors and the Government.

Operations during fiscal year. Erosion repair, downstream slope of dam. Continued routine operations and maintenance activities.

Benefits accrued to Jim Chapman Lake project: Accumulated flood damages prevented through FY 2006 are estimated at \$18,347,700.

14. JOE POOL LAKE, TX

Location. Dam is located at River Mile 11.2 on Mountain Creek, a right bank tributary of the West Fork of the Trinity River, and is adjacent to the city limits of Grand Prairie, Dallas County, Texas, which is one of the rapid growing cities in the Dallas-Fort Worth Metropolitan area.

Existing project. For description of completed improvement and authorizing acts see Annual Report of 1996. Construction of project was started in 1975 and completed for beneficial use in September 1994. Public Law 97-400, H.R. 7377, 97th Congress, effective December 31, 1982, changed the name of Lakeview Lake to Joe Pool Lake. Estimated cost of project is \$200,223,611 including \$11,350,000 contributed by local interests.

Local cooperation. The Water Supply Act of 1958 as amended, and the Federal Water Project Recreation Act of 1965 apply. Water storage space contract with the Trinity River Authority (TRA) for 142,900 acre-feet of water supply storage space was executed September 29, 1976. Final capital cost for water storage space is \$60,828,657, including Interest During Construction and contractor claims. The TRA has paid \$29,270,194 to date for water supply. FY 2006 payment of \$11,325 was received from TRA for annual operation and maintenance costs. Recreation development contract with the TRA Joe Pool Lake was executed August 2, 1976. Under this

original recreation contract, as amended, TRA had difficulty meeting its long-term capital debt repayment obligation to the Government. As a result, H.R. 4733, Title I, Section 102(b), 106th Congress, 2nd Session, authorized the city of Grand Prairie, TX, to pay the Government a total of \$4,290,000 in two installments in exchange for the local sponsorship of the recreation program, relieving TRA of any and all obligations. The city of Grand Prairie made its first installment in the amount of \$2,150,000 on December 1, 2000, and the second and final installment, in the amount of \$2,140,000, on December 1, 2003.

Operations during fiscal year. Repaired gate stem mounting brackets for flood and emergency gates. Replaced seals on bulkhead. Began painting of gates, sills and liners. Continued routine operations and maintenance activities.

Benefits accrued to Joe Pool Lake project: Accumulated flood damages prevented through FY 2007 were \$2,182,161,600.

15. JOHNSON CREEK, ARLINGTON, TX

Location. The project is located in the city of Arlington, Tarrant County, Texas, along Johnson Creek, a tributary of the West Fork of the Trinity River.

Existing Project. The Johnson Creek Watershed, which has a drainage area of 21 square miles, lies principally in Tarrant County, with a small portion lying in Dallas County. The originally authorized Johnson Creek project includes a buy-out of 140 structures for flood damage reduction, 155 acres of ecosystem restoration, and 2.25 miles of hard surface trail, picnic facilities and a pavilion. The buy-out would prevent damages during a 25-year flood event. Estimated Federal cost is \$22,339,000 (October 2006 price levels), and estimated cost to local interests is \$9,595,000. The total project cost is estimated at \$31,934,000. Construction was started in 1997 by the city of Arlington. The project was modified by Public Law 109-103, Section 134, which deauthorized 90 acres of project lands, which will be utilized by the city for other purposes. The city was required to identify replacement acreage to compensate for the deauthorized ecosystem restoration lands.

Local cooperation. The city of Arlington, Texas, signed the Project Cooperation Agreement on December 1, 2000. To date, \$7,600,000 has been contributed by the city of Arlington.

Operations during fiscal year. Construction of the authorized project was halted in FY 2006 at the request of the city of Arlington. The city has identified the replacement

lands as required by Public Law 109-103, Section 134, and has prepared a new plan for Johnson Creek. The new plan will be evaluated by the Corps in the coming fiscal year. FY 2006 expenditures for this project were \$248,098. The project is 20 percent complete overall; the completion date is uncertain because of the halting of the project, and the subsequent reevaluation.

16. LAVON LAKE, TX

Location. Dam is in Collin County, Texas, on East Fork of Trinity River 55.9 miles above its confluence with Trinity River and about 22 miles northeast of Dallas, Texas.

Existing project. For description of completed improvement and authorizing acts see Annual Report of 1962. Construction of project was started January 1948 and ready for beneficial use in September 1953. Project is complete. See following section for Lavon Lake Modification and East Fork Channel Improvement authorized by Flood Control Act of 1962. Estimated cost of project is \$12,864,796.

Local cooperation. Section 2, Flood Control Act of 1938, applies. A contract with North Texas Municipal Water District, NTMWD, for water supply storage, including cost of intake structure, was approved by Secretary of the Army July 8, 1954, at an estimated cost of \$1,405,753. Contract was revised in 1973 and final revised contract amount is \$1,445,262. To date, NTMWD has paid \$49,858,345. Under the contract, NTMWD must pay annually 13.6 percent of actual annual cost of operation and maintenance, and to date has paid \$2,282,970.

Operations during fiscal year. Executed contract for upgrading electrical wiring and controls on 12 tainter gates. Installed new waterborne restrooms with showers in East Fork and Lakeland Parks. Completed facility upgrades in East Fork Park, including realigning and repaving roads and campsite pullouts, improving drainage in campground and construction of a 10 unit equestrian camping loop. Continued routine operations and maintenance activities. During the 2007 flood, Lavon Lake was 9.67 feet above the conservation pool. The flooding caused shoreline erosion and damage to park facilities and roads.

Benefits accrued to Lavon Lake project: Accumulated flood damages prevented through FY 2007 were \$580,996,000.

17. LAVON LAKE MODIFICATION AND EAST FORK CHANNEL IMPROVEMENT, TX

Location. Existing dam is in Collin County Texas, on East Fork of Trinity River, 55.9 miles above its confluence with Trinity River and about 22.0 miles northeast of Dallas, Texas. Channel improvement of East Fork extends from its mouth to River Mile 31.8.

Existing project. For description of completed improvement and authorizing acts see Annual Report of 1988. Construction of project was initiated in May 1970 and ready for beneficial use in December 1975. Estimated Federal cost of the modification and improvement is \$70,200,000, of which approximately \$2,200,000 is non-Federal contribution for lands, damages and relocations. Project is complete.

Local cooperation. Local interests must reimburse the Federal Government for costs allocated to increased water supply storage under the terms of the Water Supply Act of 1958. The North Texas Municipal Water District, NTMWD, has contracted for 43 percent of the water supply (approved September 22, 1967, by the Secretary of the Army) and to date \$985,433 has been paid. NTMWD has submitted assurance to contract for 57 percent of future water supply. Reimbursement is currently estimated at \$39,933,278.

Levee Districts 4 and 5, which comprise the lower 10 miles of the East Fork Channel, entered into agreements as required by Section 221 of the Flood Control Act of 1970 on January 28, 1972 and have furnished all necessary construction easements.

Levee Districts 6, 8, 10, 13, and 15, which comprise the upper 15 miles of the East Fork Channel, have declined to provide the necessary assurances. On December 8, 1972, this portion of the project was reclassified from "active" to "inactive" category.

Operations during fiscal year. Continued routine operations and maintenance activities.

18. LEWISVILLE DAM, TX

Location. Dam is in Denton County, Texas, on Elm Fork of Trinity River 30 river miles above its confluence with Trinity River and about 22 miles northwest of city of Dallas, Texas at a site downstream from old Garza Dam.

Existing project. For description of completed improvement and authorizing acts see Annual Report of 1962. Construction of project was started November 1948 and ready for beneficial use in November 1954. Estimated cost of project is \$19,654,988, including \$1,117,409 contributed by local interests.

Hydropower: The city of Denton, Texas, COD, was licensed by the Federal Energy Regulatory Commission to construct a 2,000-kilowatt plant, which is located adjacent to the existing outlet channel. The project operates utilizing conservation releases, i.e., no change from the present operating regiment is anticipated. COD Utilities Department utilizes this power for its local customers. Construction of the hydropower was completed in 1991 with non-Federal funds.

Local cooperation. A contract with city of Dallas for 415,000 acre-feet of water supply storage land rights and interests to Garza Dam and Reservoir was approved by the Secretary of the Army on July 16, 1953. Local contributions have been made in full. A contract with city of Denton, Texas, for remaining 21,000 acre-feet of water supply storage was approved by the Secretary of the Army on May 20, 1954, with an estimated cost of \$250,064. Local contributions have been paid in full. Under above contracts, cities of Dallas and Denton must pay annually 21.9 and 1 percent, respectively, of actual annual cost of operation and maintenance. To date Dallas has paid \$6,550,705 and Denton \$293,663.

Operations during fiscal year. Executed contract for upgrading electrical wiring and controls to gates. Continued routine operations and maintenance activities. During the 2007 flood, Lewisville Lake was 12.04 feet above the conservation pool. The flooding caused shoreline erosion and damage to park roads and recreation facilities.

Benefits accrued to system comprised of Lewisville Lake; this includes Ray Roberts Lake and Dallas Floodway Systems. Accumulated flood damages prevented through FY 2007 were \$42,238,020,100.

19. NAVARRO MILLS LAKE, TX

Location. Dam is in Navarro County, Texas, at River Mile 63.9 on Richland Creek, a tributary of

Trinity River, about 16.0 miles southwest of Corsicana, Texas.

Existing project. For description of completed improvement and authorization acts see Annual Report of 1965. Construction started December 1959 and project completed for beneficial use March 1963. Estimated cost of project \$10,081,758 including \$300,000 contributed by local interests.

Local cooperation. The Water Supply Act of 1958, as amended, applies. A formal contract with the Trinity River Authority was approved March 3, 1966, by the Secretary of the Army at an estimated cost of \$2,260,800. To date the Authority has paid \$1,989,484 for water supply and \$2,531,327 for operation and maintenance.

Operations during fiscal year. Executed contract to upgrade electrical wiring and controls on six tainter gates. Installed fall protection device on outlet works. Installed new waterborne restrooms with showers in Liberty Hill and Oak Parks and constructed a shower building in Pecan Point Park. Upgraded 20 campsites to 50 amp electrical service. Continued routine operations and maintenance activities. During the 2007 flood, Navarro Mills Lake was 19 feet above the conservation pool. The flooding caused shoreline erosion and damage to park roads and recreation facilities.

Benefits accrued to Navarro Mills Lake project: Accumulated flood damages prevented through FY 2007 were \$59,194,000.

20. O.C. FISHER DAM AND LAKE, TX

Location. Dam is on North Concho River, a tributary of Concho River, about 6.6 miles above mouth of North Concho River near city of San Angelo, Texas.

Existing project. For description of completed improvement and authorizing acts see Annual Report of 1962. Name was changed from San Angelo Dam and Reservoir to O.C. Fisher Dam and Lake January 3, 1975 by Public Law 93-634. Construction of project was started May 1947 and ready for beneficial use February 1952. Estimated cost of project is \$16,027,467.

Local cooperation. Section 2, Flood Control Act of 1938, applies. A water supply contract with Upper Colorado River Authority for water supply storage in reservoir was approved by Secretary of the Army on October 11, 1948. The Authority has contributed \$860,444 toward cost of project and \$234,136 toward operation and maintenance for a 50-year period. The Authority must pay additional contributions of \$1 a year for useful life of project, beginning January 1, 1965.

Operations during fiscal year. Executed contract for upgrading electrical wiring and controls for gates. Continued routine operations and maintenance activities.

Benefits accrued to O.C. Fisher Dam and Lake project: Accumulated flood damages prevented through FY 2007 were \$21,140,800.

21. PROCTOR LAKE, TX

Location. Dam is at River Mile 238.9 on Leon River, a tributary of Brazos River, about 8.0 miles northeast of Comanche in Comanche County, Texas.

Existing project. For description of completed improvement and authorization act see Annual Report of 1969. Construction of project was started July 1960 and completed for beneficial use 1963. Estimated cost of project is \$14,464,585.

Local cooperation. The Water Supply Act of 1958 applies. A formal contract with the Brazos River Authority, a State agency, was approved by Secretary of the Army, July 1, 1960, and was modified and approved May 9, 1966, at an estimated cost of \$1,707,900. To date the Authority has paid \$731,202 for water supply and \$1,167,633 for operation and maintenance.

Operations during fiscal year. Executed contract for upgrading electrical wiring and controls for gates. Proctor Lake received \$800,000 in emergency funding in FY 2007 for construction of an engineered access road along the downstream toe to allow stable vehicle access, filtering of seepage and mapping of seepage. Continued routine operations and maintenance activities. During the 2007 flood, Proctor Lake was 35.31 feet above the conservation pool. The flooding caused damage to park roads and recreation facilities.

Benefits accrued to Proctor Lake project: Accumulated flood damages prevented through FY 2007 were \$81,234,000.

22. RAY ROBERTS LAKE, TX

Location. Dam site is located at River Mile 60.0 on the Elm Fork of the Trinity River, Denton County, between Sanger and Aubrey, Texas and 30 miles upstream from Lewisville Dam.

Existing project. The plan of improvement provides for construction of an earthfilled dam with a maximum height of 141 feet above the streambed, a length of 15,250 feet including an uncontrolled broadcrested spillway 100 feet long, controlling 682 square miles of drainage area. The lake will have a total controlled storage of 1,064,600 acre-feet, with a water surface area of 36,900 acres. The total storage includes 260,800 acre-feet for flood control, 749,200 acre-feet for water supply, and 54,600 acre-feet for sediment reserve. The Water Resources Development Act of 1990 authorized the Greenbelt Corridor between Lewisville and Ray Roberts Lakes. Estimated Federal cost of the project is \$319,653,200. Public Law 96-384, 96th Congress, H.R. 8094, effective January 4, 1981, changed the name of Aubrey Lake to Ray Roberts Lake.

Hydropower: At the request of the city of Denton and the approval of the Secretary of the Army the penstock was added to the embankment as a minimum facility for future hydropower. The city of Denton, Texas, COD, was licensed by the Federal Energy Regulatory Commission to construct a 1,000-kilowatt plant, which is located adjacent to the existing outlet channel. The project operates utilizing conservation releases, i.e., no change from the present operating regiment is anticipated. COD Utilities Department utilizes this power for its local customers. Construction of the hydropower was completed in 1991 with non-Federal funds.

Local cooperation. The Water Supply Act of 1958, as amended, and the Federal Water Project Recreation Act of 1965 and Section 221, Flood Control Act of 1970 apply. Contracts with the cities of Dallas and Denton, Texas, for water supply storage and recreation were approved by the Secretary of the Army, September 16, 1980. To date the cities of Dallas and Denton have paid in full their share of the water supply storage. Dallas has paid \$1,518,745 and Denton has paid \$533,597 toward annual cost of operation and maintenance.

Operations during fiscal year. Continued routine operations and maintenance activities. During the 2007 flood, Ray Roberts Lake was 8.52 feet above the conservation pool. The flooding caused instability to riprap along the outlet works discharge channel and damage to park roads and recreation facilities.

Benefits accrued to Ray Roberts Lake project: Accumulated flood damage prevented is shown with Lewisville Dam, TX.

23. SAN ANTONIO CHANNEL IMPROVEMENT, TX

Location. Floodway is in the city of San Antonio, Bexar County, Texas, on the San Antonio River and San Pedro, Apache, Alazan, Martinez, and Six Mile Creeks.

Existing Project. The project consists of 30.7 miles of channel and associated improvements on six separate streams. Completion of detailed engineering and design studies revealed that the least costly alternative for the remaining channel improvements would consist of two tunnels 120 feet below the surface each having an inside diameter of 24 feet and vertical intake, outlet and access shafts. The San Pedro Creek tunnel is 6,040 feet in length and the San Antonio River tunnel is 16,360 feet in length. Construction of the initially authorized project was initiated in FY 1957. Estimated Federal cost of this project is \$224,900,000 (Oct. 1, 2006, base price), and estimated cost to local interests is \$106,100, which includes \$30,220,000 cash contributions and \$75,880,000 for lands, damages, work-in-kind, and construction, a total of \$331,000,000. The originally authorized project for flood risk management is complete. The remaining project for ecosystem restoration and recreation includes the creation of 113 acres of aquatic and 320 acres of riparian habitat and 55,800 feet of multi-purpose recreation trails. Improvements for flood risk management considered for the Woodlawn area will consist of channel modifications, detention dams and buyouts.

Local cooperation. Local interests must furnish lands and rights-of-way for construction, including purchase and removal of buildings, relocation or reconstruction of bridges (exclusive of railway bridges), channel dams where applicable, and utility lines; hold the United States free from damages; maintain and operate all works after completion; and provide a cash contribution for enhancement benefits of 2.65 percent of actual Federal construction cost. San Antonio River Authority furnished assurances that it will comply with all requirements of local cooperation. These assurances were accepted by the District Engineer on April 15, 1957. To date \$4,088,579 has been contributed by San Antonio River Authority.

Operations during fiscal year. During FY 2007, funds were used to complete 95 percent design of Phase I and award the woody vegetation contract in the Mission Reach. Continuation of General Reevaluation studies for the Woodlawn Lake area.

Benefits accrued to San Antonio project: Accumulated damages prevented through FY 2006 were \$500,792,200.

24. SAN GABRIEL RIVER, TX

Location. Project is a system of three reservoirs in Williamson County in the central portion of Brazos River Basin, which consists of Granger Dam at River Mile 31.9 on San Gabriel River, about 7.0 miles east of Granger, Texas; North San Gabriel Dam at River Mile 4.3 on North Fork of San Gabriel River, about 3.5 miles northwest of Georgetown, Texas; and South Fork Dam at River Mile 4.7 on South Fork of San Gabriel River, about 3.0 miles southwest of Georgetown, Texas.

Existing project. For description of completed improvements and authorizing acts, see the Annual Report of 2001. Construction of Granger Lake started in October 1972 and the project was ready for beneficial use in January 1980. Estimated cost of project is \$62,061,653. Construction of North San Gabriel Dam and Lake Georgetown started in October 1972 and the project was ready for beneficial use in March 1980. Estimated cost of project is \$38,765,313. The South Fork Lake project will be proposed for deauthorization in the next Water Resources Development Act.

Local cooperation. Construction is subject to condition that local interests reimburse the Federal Government for costs allocated to water supply at Granger, Georgetown, and South Fork Lakes. Reimbursement currently estimated at \$13,315,000 for Granger, \$6,295,000 for Georgetown, and \$50,563,000 for South Fork, for a total of \$70,172,000, exclusive of interest. Brazos River Authority, a State agency, is the local interests' sponsor of project, and by letter dated April 18, 1966, indicated its acceptance of the proposed plan of development and its willingness to pay for the costs allocated to water supply in each reservoir in the ultimate plan. Such water supply assurances for Granger and Georgetown Lakes were approved May 24, 1968 as satisfactory in accordance with requirements of the Water Supply Act of 1958, as amended.

Operations during fiscal year. Granger: repaired flood gate cylinders, completed repairs to main access road in Friendship Park, continued successful volunteer program and strong water safety outreach programs. Georgetown: repaired gate seals in outlet works, continued successful volunteer program and strong water safety outreach programs. Routine operation and maintenance continued at both projects. During the 2007 flood, Granger Lake was 23.56 feet above the conservation pool and Georgetown was 43 feet above the conservation pool. The flooding caused damage to park roads

and recreation facilities in both lakes. Lake Georgetown facilities were 50 percent inundated by flood waters.

Benefits accrued to project consisting of Granger and Georgetown: Accumulated flood damages prevented through FY 2007 were \$77,580,800.

25. SOMERVILLE LAKE, TX

Location. Dam is on Yegua Creek 20 miles upstream from its confluence with Brazos River and about 2 miles south of Somerville, Texas.

Existing project. For description of completed improvements and authorizing act see Annual Report of 1969. Construction started in June 1962 and the project was ready for beneficial use in January 1967. Estimated cost of project is \$27,790,437.

Local cooperation. The Water Supply Act of 1958, as amended, applies. A contract with the Brazos River Authority, a State agency, for water supply storage approved May 10, 1962, by the Secretary of the Army, has paid \$3,395,564 to date. Also under the contract, the Authority must pay annually 28.655 percent of the actual annual cost of operation and maintenance. FY 2006 payment of \$300,528 was received from the Authority.

Operations during fiscal year. Repaired failed expansion joint and foundation drainage system. Continued successful volunteer program and strong water safety outreach program. Continued routine operations and maintenance activities. During the 2007 flood, Somerville Lake was 19.89 feet above the conservation pool. The flooding caused shoreline erosion and damage to park roads and recreation facilities.

Benefits accrued to Somerville Lake project: Accumulated flood damages prevented through FY 2007 were \$183,409,800.

26. STILLHOUSE HOLLOW DAM, TX

Location. Dam is on Lampasas River 16 miles upstream from its confluence with Little River, a tributary of the Brazos River, and about 5 miles southwest of Belton, Texas.

Existing project. For description of completed improvements and authorizing act see Annual Report of 1969. Construction was initiated in July 1962 and the project was ready for beneficial use in February 1968. Estimated cost of project is \$20,522,084.

Local cooperation. The Water Supply Act of 1958 applies. A contract with the Brazos River Authority, a State agency, for water supply storage was approved April 13, 1962, by the Secretary of the Army, at an estimated cost of \$6,912,430. To date the Authority has paid \$4,627,461. Also under the contract the Authority must pay annually 27.748 percent of the actual annual cost of operation and maintenance. To date the Authority has paid \$3,021,181.

Operations during fiscal year. Successful volunteer program and strong water safety outreach program. Continued routine operations and maintenance activities. During the 2007 flood, Stillhouse Hollow Lake was 43.93 feet above the conservation pool. The flooding caused damage to park roads and recreation facilities. Stillhouse Hollow Lake facilities were 98 percent inundated by flood waters.

Benefits accrued to Stillhouse Hollow Dam Project: Accumulated estimate of flood damages prevented through FY 2007 is \$126,310,200.

27. WACO LAKE, TX

Location. Dam is on Bosque River, 4.6 river miles above its confluence with Brazos River, at city of Waco, McLennan County, Texas.

Existing project. For description of completed improvements and authorizing act see Annual Report of 1969. Estimated cost of project is \$52,755,921. Construction was started in July 1958, and project was ready for beneficial use in February 1965.

Local cooperation. Section G of the Flood Control Act of December 1944 applies. A contract with the Brazos River Authority, a State agency, for water supply storage and the contract with the city of Waco transferring the existing Lake Waco to the Government for their water storage, was approved by the Secretary of the Army on April 15, 1958. To date, the Authority for their portion of the water supply storage has paid \$4,123,354. Also under the contract the Authority and the city must pay 14.706 and 2.087 percent respectively of the actual cost of operation and maintenance. To date the Authority has paid \$2,587,548 and the city has paid \$381,679. A contract with the Brazos River Authority, for additional storage for municipal and industrial water

supply, was approved by the Acting Assistant Secretary of the Army, September 28, 1984.

Operations during fiscal year. Continued routine operations and maintenance activities. During the 2007 flood, Waco Lake was 37.76 feet above the conservation pool. The flooding caused damage to park roads and recreation facilities.

Benefits accrued to Waco Lake project: Accumulated flood damages prevented through FY 2007 were \$418,100,400.

28. WRIGHT PATMAN DAM AND LAKE, TX

Location. Dam is on Sulphur River in Cass and Bowie Counties, Texas. Dam is 45 miles above mouth of Sulphur River, and about 8 miles southwest of Texarkana, Texas.

Existing project. For description of completed improvements and authorizing act see Annual Report of 1984. Estimated cost of project is \$51,793,437, which includes \$1,606,418 Code 711, \$399,939 accelerated public works funds, and \$13,138,004 to be reimbursed by local interests, over a period not to exceed 50 years, for water supply storage, and including \$2,092,040 for pro rata share of original reservoir cost. Construction was initiated in August 1948 and completed in March 1962, except real estate activities, construction under Code 711, and conversion of 120,000 acre-feet to water supply storage after completion of Cooper Reservoir (now Jim Chapman Lake). This project transferred to the Fort Worth District as of the end of FY 1979.

Local cooperation. A contract with the city of Texarkana, Texas, for reserving water supply storage space was approved by the Secretary of the Army December 17, 1968. To date, the city has paid \$1,110,622. The city has paid \$869,977 toward operation and maintenance costs of the project.

Operations during fiscal year. Executed contract for upgrading electrical wiring and controls on gates. Upgraded beach area in Rocky Point Park. Restriped all parking lots and roads. Completed repairs of boat ramp at Piney Point Park. Installed playground system at Malden Lake Park. Upgraded 11 campsites to 50 amp service at Clear Springs Park and upgraded 12 campsites to 50 amp service at Rocky Point Park. Designed and constructed three

volunteer campsites at various parks. Continued successful volunteer program. Continued routine operations and maintenance activities. During the 2007 flood, Wright Patman Lake was 9.59 feet above the conservation pool. The flooding caused damage to park roads and recreation facilities.

Benefits accrued to Wright Patman Dam and Lake project: Accumulated flood damages prevented through FY 2007 were \$95,291,600.

29. INSPECTION OF COMPLETED FLOOD CONTROL PROJECTS

Inspection of completed local flood protection projects is made periodically in compliance with Section 208. 10, of Title 33, Code of Federal Regulations, which contains regulations for operation and maintenance of local flood-protection works approved by the Secretary of the Army in accordance with authority in Section 3, Flood Control Act of 1936. See Table 39-D for inspections made this fiscal year.

Total inspection costs for FY 2007 from regular funds for maintenance were \$164,182.

30. SCHEDULING FLOOD CONTROL RESERVOIR OPERATIONS

In accordance with Flood Control Act of 1944, expenditures were made for scheduling flood control reservoir operations and preparation of reservoir regulation manual for Marshall Ford Dam, on the Colorado River, near city of Austin, Texas, and for preparation of reservoir regulation manual for Twin Buttes Dam, on Middle and South Concho Rivers near city of San Angelo, Texas. Marshall Ford Dam was authorized by 1937 River and Harbor Act. Project was constructed jointly by Bureau of Reclamation and Lower Colorado River Authority and was completed during FY 1942. Twin Buttes

Reservoir was authorized for construction by Department of Interior by Public Law 152, 85th Congress. Construction was initiated in June 1960; closure of dam started in June 1962; deliberate impoundment was started January 23, 1963.

Accumulated damages prevented by Marshall Ford Reservoir through FY 2007 were \$428,928,800 and by Twin Buttes through FY 2007 were \$1,179,850. Twin Buttes Reservoir consists of two separate pools, one on South Concho River and the other on Middle Concho River and Spring Creek. Equalizing channel between these two pools is at elevation 1925.0.

Total expenditures for scheduling reservoir operations in FY 2007 were \$71,011.

31. OTHER AUTHORIZED FLOOD CONTROL PROJECTS

(See Table 39-C.)

32. WORK UNDER SPECIAL AUTHORIZATION

(See Table 39-E.)

Flood control activities pursuant to Section 205, Public Law 585, 80th Congress, as amended (preauthorization); Emergency stream bank protection under Section 14, Public Law 526, 79th Congress, as amended; Snagging and Clearing of navigable streams and tributaries in interest of flood control Section 208, Public Law 780, 83rd Congress, as amended. Emergency flood control, hurricane-flood, and shore protection activities, Public Law 99, 84th Congress, and antecedent legislation, Environmental restoration under Section 1135, Public Law 662, 99th Congress, as amended; Aquatic ecosystem restoration under Section 206, Public Law 303, 104th Congress.

Fiscal year costs were \$10,905 for Operations & Maintenance funded catastrophic disaster preparedness program; \$2,369,729 for nationwide civil works activities, recreation; \$359,981 for Flood Control and Coastal Emergencies funded disaster preparedness program; \$9,191 for levee repairs, rehabilitation and inspection program; \$85,421 for response operations (operational support), and, \$525,937 for response operations (Proctor Lake).

Multi-Purpose Projects Including Power

33. ROBERT DOUGLAS WILLIS HYDROPOWER, TX

Location. For location of completed dam see Town Bluff Dam-B.A. Steinhagen Lake, Texas, section 35 in this chapter.

Existing project. Installation of hydroelectric power generating facilities at Town Bluff Dam was authorized by the River and Harbor Act of 1945 (Public Law 79-14), March 2, 1945, but deferred in the original construction. Town Bluff Dam was completed and placed in operation in 1951. A Design Analysis Report completed in April 1982 and a Feasibility Report approved September 9, 1983 indicated that installing hydropower at this project

was economically feasible. The hydropower facilities include a 7,400-kilowatt power plant (two units at 3,700 kilowatts each), intake and outlet facilities, and necessary switchgear equipment is located in the main embankment at the old diversion channel. The plant is operated remotely from the Sam Rayburn project. The project produces an estimated 35,900 megawatt hours of energy per year. There is no Federal cost on this project; it is completely funded by non-Federal funds. The estimated non-Federal cost is \$18,643,000. 101st Congress House Report 923, effective February 7, 1989, changed the name of Town Bluff Hydropower to Robert Douglas Willis Hydropower.

Local cooperation. A contract with the Sam Rayburn Municipal Power Authority was approved by Secretary of the Army, June 28, 1985, relative to financing, escrow agreement, and power sales agreement.

Operations during fiscal year. Continued routine operations and maintenance activities.

34. SAM RAYBURN DAM AND RESERVOIR, TX

Location. Dam is on Angelina River 25.2 miles upstream from its confluence with Neches River and about 10.0 miles northwest of Jasper, Texas.

Existing project. For description of completed improvements and authorizing act see Annual Report of 1969. Construction was started August 1956 and project was ready for beneficial use in March 1965. Estimated cost of project is \$68,683,000 including \$3,000,000 contributed by local interests.

Local cooperation. A contract with the Lower Neches Valley Authority, a State agency, to contribute \$3,000,000 toward the first cost and an additional \$200,000 annually for 50 years after completion of the project was approved by the Secretary of the Army on January 22, 1957. Contribution of \$3,000,000 was made in full and annual payments to date of \$5,800,000 have been made by the Authority.

A contract with the city of Lufkin for water supply storage was approved May 27, 1969, by the Secretary of the Army at an estimated cost of \$525,600. To date, the city has paid \$1,954,310. Also under the contract the city of Lufkin must pay annually 0.692 percent of the annual cost of operation and maintenance. To date, the city has paid \$314,570.

Operations during fiscal year. Installed security fence around switchyard. Rehabilitated non-functioning embankment relief wells and repaired seepage collection

system at east abutment. Supplemental funds issued as a result of Hurricane Rita were used to repair the embankment and inlet dike, repair recreation facilities, replace restrooms, repair roads and clean up debris. Continued routine operations and maintenance activities.

Benefits accrued to Sam Rayburn project: Accumulated flood damages prevented through FY 2007 were \$1,130,060,800.

35. TOWN BLUFF DAM - B. A. STEINHAGEN LAKE, TX

Location. Dam is on Neches River about 12.4 miles below mouth of Angelina River, one-half mile north of Town Bluff, Texas, and 93.0 river miles north of Beaumont, Texas.

Existing project. For description of completed improvement and authorizing acts see Annual Report of 1962. Construction started March 1947 and project was ready for beneficial use in April 1951. Estimated cost of project is \$8,577,396, including \$2,000,000 contribution by local interests.

Local cooperation. Completed as required.

Operations during fiscal year. Repaired tainter gate electrical and control systems. Supplemental funds issued as a result of Hurricane Rita were used to repair erosion downstream of tainter gates and power plant, repair recreation facilities and prime facilities, and clean up debris. Continued routine operations and maintenance activities.

36. WHITNEY LAKE, TX

Location. Dam is on Brazos River, about 442 miles above mouth of river, 5.5 miles southwest of Whitney, Texas, and about 38 miles upstream from city of Waco, Texas.

Existing project. For description of completed improvement and authorizing acts see Annual Report of 1962. Construction of project was started May 1947 and ready for flood control use in December 1951. First power was placed on the line in June 1953. Raise power pool is complete. Estimated cost of project is \$42,952,939.

Local cooperation. Section 2, Flood Control Act of 1938, applies. A contract with the Brazos River Authority, a State agency, for water supply storage was approved by the Secretary of the Army November 3, 1982. To date, the Authority has paid \$286,964.

Operations during fiscal year. Complete Phase II at Ham Creek and Kimball Bend Parks. The work accomplished at Ham Creek Park included installation of day use facilities, family shelters and picnic sets, and roads. Work completed at Kimball Bend Park included the installation of 36 campsites and a gatehouse complex. Continued routine operations and maintenance activities. During the 2007 flood, Whitney Lake was 23.88 feet above the conservation pool. All of the parks were closed due to the flooding. The flood event occurred during the peak of the recreational season, which devastated the local economy.

Benefits accrued to Whitney Lake project: Accumulated flood damages prevented through FY 2007 were \$950,082,300.

37. WHITNEY LAKE (POWERHOUSE), TX (MAJOR REHAB)

Location. Whitney Lake is located on the Brazos River, about 75 miles southwest of Dallas, Texas. The powerhouse is located at the dam, approximately 5.5 miles southwest of Whitney, Texas, on State Highway 22.

Existing Project. Replace the two turbines, rewind and uprate the two generators, and replace necessary peripheral items and equipment within the powerhouse. The total increase in power output of the plant will be from 30 megawatts to 42 megawatts.

Local Cooperation. The power produced by the project is marketed by the Southwestern Power Administration to the Brazos Electric Power Cooperative as part of the Electric Reliability Council of Texas (ERCOT). The project is to be 100 percent Federally funded with payback from the Southwestern Power Administration's sale of power. Reimbursement payments will be initiated at the completion of construction.

Operations during fiscal year. Completed rehabilitation of the powerhouse overhead crane, awarded the base bid of the turbine and generator contract, and evaluated contractor submittals and design.

General Investigations

38. SURVEYS

Fiscal year costs for reconnaissance and feasibility studies were \$448,664 for flood damage prevention studies and \$1,392,781 for ecosystem restoration studies. Miscellaneous activities include \$31,685 for Coordination with Other Agencies; \$31,488 for Special Investigations; \$66,047 for Planning Assistance to States; \$25,851 for Inter-agency Water Resource Development; \$2,107 for North American Waterfowl Management.

39. PRECONSTRUCTION ENGINEERING AND DESIGN

L COLORADO RIV, WHARTON/ONION, TX

The project areas are located in southeast Austin and southeast Travis County along Onion Creek, and in the city of Wharton, along the lower portion of the Colorado River. The Onion Creek component, with an estimated first cost of \$83,200,000 (October 2006 prices), would consist of a buyout of approximately 490 structures, with the vacated area being redeveloped to produce ecosystem restoration and passive recreational outputs. The city of Wharton component, with an estimated first cost of \$27,600,000 (October 2006 prices), would provide flood damage reduction to the city, and would consist of levees, a small channel modification and other associated drainage features. Monetary net benefits for both components are estimated at \$4,900,000. The Onion Creek component, with an estimated first cost of \$83,200,000 (October 2006 prices), would consist of a buyout of approximately 490 structures, with the vacated area being redeveloped to produce ecosystem restoration and passive recreational outputs. The city of Wharton component, with an estimated first cost of \$27,600,000 (October 2006 prices), would provide flood damage reduction to the city, and would consist of levees, a small channel modification and other associated drainage features. Monetary net benefits for both components are estimated at \$4.9 million annually. In addition, the Onion Creek component would produce ecosystem restoration outputs estimated at 62.7 habit units annually. In addition, the Onion Creek component would produce ecosystem restoration

RIVERSIDE OXBOW, TX

The Riverside Oxbow project is located just east of downtown Fort Worth on the West Fork of the Trinity River. The project provides for ecosystem restoration of 490 acres of floodplain lands (including 57 acres of wetlands and 2 miles of

oxbow river channel), 112 acres of uplands, replacement of the Beach Street bridge, and 25,700 feet of mixed surface linear recreation trails. The Chief's Report was signed on 29 May 2003. The estimated first cost of the plan is \$29,696,000, with a Federal cost of \$11,984,000 and a non-Federal cost of \$17,712,000. The Tarrant Regional Water District has indicated its intent to act as the local sponsor and will fund the non-Federal portion of this project. The project is currently on hold pending project authorization and the appropriation of Federal construction funds.

40. COLLECTION AND STUDY OF BASIC DATA

Work continued under the Flood Plain Management Services on the compilation of information on floods and potential flood damages, including identification of those areas subject to inundation. FY 2007 expenditures for these activities totaled \$169,236. FY 2007 costs for hydrologic studies were \$26.

MISCELLANEOUS (WATER SUPPLY)

41. TEXAS WATER ALLOCATION ASSESSMENT

The study area includes the state of Texas. The study was authorized in response to Texas Senate Bill 1 and the establishment of the Regional Planning Groups. These groups are responsible for developing plans (every five years) to meet future water supply needs in their region for the next fifty years. The objective is to identify potential opportunities for the Corps to assist the state in meeting future water needs through immediate technical assistance, and/or through initiation of studies leading to possible implementation of cost-shared water resources projects. Work is being accomplished by Fort Worth district in-house staff, other Districts in Southwestern Division, the U. S. Geological Survey, Texas Water Development Board, academia, and Architect/Engineer contractors. FY 2007 expenditures were \$722,159. Funds were used to complete the scheduled Regulatory permit workshop activities; continue the Lake Kemp yield study; data collection and analyses of the proposed Cedar Ridge Reservoir; and, to complete a study identifying improvements to current bathymetric survey techniques. The study cost is \$6,900,000, and is 100 percent Federally funded.

¹ Excludes \$47,309 receipts from reconveyance of land deposited to miscellaneous receipts.

² Excludes \$322,346 receipts from reconveyance of land deposited to miscellaneous receipts.

³ Excludes \$1,422,848 expended for new work from contributed funds, including \$22,848 “Contributed Funds Other” for installation and operation of gages for leakage study.

⁴ Includes \$1,775,990 for Code 711 and \$399,739 accelerated Public Works Act funds. Excludes \$1,711,200 contributed funds.

⁵ Includes \$1,376,322 for Code 711, \$52,808 for Code 713, and 399 accelerated Public Works Act funds. Excludes \$4,137 reimbursed in Fiscal Year 1973.

⁶ Claim Northeast Texas Municipal Water District \$16,546. Three payments of \$12,410 less real charges of \$1,325, making a total of \$2,811 reimbursed in Fiscal Year 1972, Fiscal Year 1973, and Fiscal Year 1974.

⁷ Excludes \$146,795 receipts from reconveyance of land deposited to miscellaneous receipts, and \$2,040,026 for new work expended from contributed funds.

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

⁸ Excludes \$105,079 expended from contributed funds.

⁹ Excludes receipts from reconveyance of land of \$426,606 that were deposited to miscellaneous receipts, and \$3,676,661 for new work expended from contributed funds. Includes \$1,641,977 for Code 711.

¹⁰ Includes \$130,000 under appropriation 96X5125.

¹¹ Excludes \$300,000 expended from contributed funds.

¹² Excludes \$3,000,000 expended from contributed funds.

¹³ Includes receipts from disposals and revocation of funds related hereto.

¹⁴ Excludes \$2,000,000 contributed funds expended.

¹⁵ Excludes \$2,750,000 expended for contributed funds.

¹⁶ Excludes \$188,282 receipts from reconveyance of lands deposited to miscellaneous accounts.

¹⁷ Includes funds provided by the Jobs Act (PL 98-8, dated march 24,1983).

¹⁸ Beginning Fiscal Year 1985 data shown on Table A includes Special Recreational Use Fees. Data for previous fiscal years have changed to conform to the new procedure.

¹⁹ Excludes \$399,939 accelerated public works funds, \$13,138,004 to be reimbursed by local interests over a period not to exceed 50 years for water supply storage, and \$2,092,040 for pro rata share of original reservoir cost.

GALVESTON, TX, DISTRICT

Galveston District comprises drainage basins of all short streams arising in coastal plain of Texas and flowing into the Gulf of Mexico, including the entire basin of Buffalo Bayou, San Jacinto, San Bernard, Lavaca, Navidad, Mission, and Aransas Rivers. It embraces Agua Dulce, San Fernando, and Olmos Creek Basins draining into Baffin Bay, and coastal area south thereof to the Rio Grande and east of western Boundary of Starr County, Texas. It includes lower basins of major streams flowing into the Gulf of Mexico: Sabine River, Texas and Louisiana, downstream from U.S. Highway 190 crossing at Bon

Wier, Texas; Neches River downstream from Town Bluff gageing station; Trinity River downstream from Texas State Highway 19 crossing at Riverside, Texas; Brazos River downstream from confluence with Navasota River; Colorado River downstream from northern boundary of Fayette County; Guadalupe River downstream from confluence with San Marcos River; San Antonio River downstream from confluence with Escondido Creek; Nueces River downstream from confluence with Frio and Atascosa River.

Navigation

1. AQUATIC PLANT CONTROL, TX (SOUTHWESTERN DIVISION) 1965 ACT

Location. Navigable waters, tributary streams, connecting channels, and other allied waters in Texas.

Previous project. For details see page 699 of Annual Report for 1963.

Existing project. A comprehensive project to provide for control and progressive eradication of water-hyacinth, alligator weed, Eurasian watermilfoil, hydrilla, and other obnoxious aquatic plant growths, from navigable waters, tributary streams, connecting channels, and other allied waters in Texas in the combined interest of navigation, flood control, drainage, agriculture, fish and wildlife conservation, public health, and related purposes, including continued research for development of the most effective and economic control measures.

Control of water-hyacinth and alligator weed has been approved for the Nueces River Basin, North Coastal Area, Guadalupe River Basin, Sabine River Basin, Trinity River Basin, Cypress Creek Basin, Neches River Basin, South Coastal Area, San Jacinto River Basin, Rio Grande Basin, Colorado River Basin and Brazos River Basin.

Control of hydrilla and watermilfoil is on a site by site basis after analysis and issuance of National Environmental Policy Act documentation

Local cooperation. Sec. 302, 1965 River and Harbor Act, amended by Water Resources Development Act of 1986, applies.

Operations during fiscal year. A cost-sharing, cost-reimbursable contract, with the State of Texas ended in FY 2005.

Work on an Environmental Assessment is being completed to add control of hydrilla, giant salvinia, and giant reed to the list of invasive aquatic plants to be treated, as well as torpedo grass, water spinach, giant duckweed, paper bark and water trumpet.

The State of Texas received no aquatic plant funding in fiscal year 2007. No cost was incurred for fiscal year 2007.

2. BRAZOS ISLAND HARBOR, TX

Location. At extreme south end of coast of Texas, about 7 miles north of mouth of Rio Grande and about 5 miles east of Brownsville, Texas. (See National Ocean Survey Chart 11301.)

Previous project. For details see page 1017 of Annual Report for 1932.

Existing project. Provides for channel dimensions in various sections of the waterway as shown in Table 40-H.

Project also provides for dual jetties at the gulf entrance, a north jetty 6,330 feet long, a south jetty 5,092 feet long, and 1,000-foot extension to existing north jetty and for maintenance of 3rd fishing harbor constructed by local interests. Under ordinary conditions, mean tidal range is about 1.5 feet, and extreme range is about 2 feet. All depths refer to mean low tide. To some extent, height of tides is dependent on the wind, and during strong "northers" in winter season, water surface in southern end of Laguna Madre may be raised 4 feet or more above mean low tide in the gulf.

Widening Brownsville Channel from Goose Island to Brownsville turning basin and deepening southeast corner of Brownsville turning basin to 36 feet was completed in April 1980. The 1,000-foot extension to existing north jetty was de-authorized under Section 1001 of the Water Resources Development Act of 1986. The entrance channel was enlarged from 38 feet by 300 feet to 44 feet by 300 feet in FY 1992. Construction of an environmental mitigation site consisting of the creation of a 16-acre tidal wetland which included shoal grass and black mangroves, was completed in 1997. (See Table 40-G for total cost of existing project to September 30, 2007.)

Local cooperation. Fully complied with.

Terminal facilities. Numerous terminal facilities for bulk and liquid cargo are available. (See Port Series No. 26, revised 2002.) Facilities are adequate for existing commerce.

Operations during fiscal year. Maintenance: Routine maintenance (See Table 40-J for dredging operations.)

3. CEDAR BAYOU, TX.

Location. The bayou is about 30 miles long. It flows to the south and empties into northwest corner of upper Galveston Bay, about 1.5 miles below mouth of San Jacinto River and about 28.5 miles north of Galveston, Texas. (See National Ocean Survey Chart 11326.)

Previous project. For details see Annual Report for 1938.

Existing project. Project provides for a channel 10 feet by 100 feet from Houston Ship Channel to Bayou Mile 11.0. Channel was completed from Houston Ship Channel to first bend in Cedar Bayou above the mouth in 1931. Channel from Mile -0.1 to Mile 3.0 was completed in March 1975. Channel from 3.0 to Mile 11.0 was de-authorized under Sec. 12 of Public Law 93-251 and re-authorized in December 2000 under Sec. 349 (a) (2) of Public Law 106-541, the Water Resources

Development Act of 2000. Project also includes jetties at mouth of bayou provided for under previous project.

Under ordinary conditions, mean tidal range is about 0.6 feet and extreme range 1.2 feet. Height of tides is dependent largely on the wind, and during strong "northers" in the winter season water surface may be depressed 2 feet below mean low tide.

A Feasibility Report to extend the Federal channel further inland was prepared by the Sponsor and approved by the Assistant Secretary of the Army, Civil Works (ASA, CW) on July 10, 2006. The recommended project extends the channel 8 miles at the dimensions of 10 x 100 from Mile 3.0 to Mile 11.0, or just below State Highway 146. The Cedar Bayou waterfront, located directly across the Houston Ship Channel from the Barbour Cut Channel and Bayport container terminals is mainly industrial and is now experiencing huge industrial development that will result in an increase in shipping up and down the proposed channel.

Estimated cost for new work is \$10,968,000 Federal (Corps); and \$1,219,000 non-Federal, \$1,860,000 for lands and damages, and \$2,107,000 for associated costs. (October 1, 2007 base price.)

(See Table 40-G for total cost of existing project to September 30, 2007.)

Local cooperation. Fully complied with. The Non-Federal Sponsor for the project is the Chambers County Cedar Bayou Navigation District. A Design Agreement was executed in February 2006. The Preconstruction Engineering and Design (PED) costs will ultimately be cost shared at the construction cost share ratio but will be financed through the PED period at 25 percent non-Federal cost. In late FY 06 the Sponsor applied for and received ASA, CW approval to advance non-Federal funds in the amount of \$450,000 to continue work on plans and specifications. The funds will be credited toward the Sponsor's share of construction.

The Project Cooperation Agreement has not been executed pending receipt of Federal funding for construction. During the period of construction, the Non-Federal Sponsor is required to pay 10 percent of the cost of the general navigation features of the project, and pay an additional 10 percent of the cost of the general navigation features of the project over a period not to exceed 30 years following completion of the project.

Terminal facilities. U.S. Steel Company has a barge dock at bayou mile 2.8, and there are a few small wharves, privately owned, for local use at various places along Cedar Bayou. Facilities are considered adequate for existing commerce.

Operations during fiscal year. New Work: See Section 35, PRE-CONSTRUCTION ENGINEERING AND DESIGN. Maintenance: No maintenance performed during this fiscal year.

4. CHANNEL TO PORT BOLIVAR, TX

Location. Port Bolivar is at end of Bolivar Peninsula and 4 miles north of city of Galveston. Channel connects the port with channel in Galveston Harbor. (See National Ocean Survey Chart 11324.)

Previous project. For details see page 1856 of Appendix to Annual Report for 1915.

Existing project. Existing project dimensions for channel are shown in Table 40-H. (Also see Table 40-B for authorizing legislation.)

Under ordinary conditions, mean tidal range is about 1.3 feet and extreme range 2 feet. Height of tides is dependent largely on the wind, and during strong "northers" in the winter season water surface may be depressed 2 feet below mean low tide. Enlargement of turning basin from 1,000 to 1,600 feet is inactive. A channel 14 feet deep, 200 feet wide, and approximately 950 feet long is maintained across the east end of the turning basin to accommodate the Galveston-Port Bolivar ferry. Project is complete except for inactive portion. Project dimensions have not been maintained in the completed part since lesser dimensions are adequate for existing commerce. (See Table 40-G for total cost of existing project to September 30, 2007.)

Local cooperation. None required.

Terminal facilities. Terminals are privately owned and consist of 2 slips and 2 piers. The piers, 400 feet wide by 1,200 feet long and 210 feet wide by 1,200 feet long, are badly deteriorated and not in use. The slips are used as anchorage by shallow-draft vessels. A highway ferry landing owned by the State of Texas is located at south end of turning basin. Facilities are considered adequate for existing commerce.

Operations during fiscal year. Maintenance: No maintenance performed during the fiscal year.

5. CHOCOLATE BAYOU DREDGED MATERIAL MANAGEMENT PLAN (DMMP), TX

Location. The Chocolate Bayou Channel is a navigation project located about 40 miles southwest of Houston in Chocolate Bay in Brazoria County, along the upper coast of Texas.

Existing project. The Chocolate Bayou Channel is federally authorized and currently maintained at 12-foot deep (MLT) by 125-foot wide. The channel traverses Chocolate Bay connecting industries at the northwest end of the bay within Chocolate Bayou with the Gulf Intracoastal Waterway (GIWW) between GIWW mile markers 374.7 and 376.7. The authorized channel is 8.2 miles long (13.2 miles to the turning basin) and used primarily for transport of crude petroleum and

petrochemical products. The maintenance dredging frequency for the channel is every four years.

This project provides a long-term management plan that will utilize maintenance material from dredging of the Chocolate Bayou Channel, over a 20-year period, to create and enhance approximately 560 acres of marsh and bird-nesting habitat within the Chocolate Bay area. Since 1950, approximately 32,400 acres of wetlands have been lost in the Chocolate Bay system. The development of long-term beneficial use sites will have a cumulative beneficial effect on the biological resources of the Chocolate Bayou system. Additionally, the beneficial use of the dredged material over the next 20 years will extend the life of existing upland confined placement areas. The Dredged Material Management Plan was approved in December 2004.

Estimated cost for new work is \$8,909,000 Federal (Corps); and \$990,000 non-Federal. (October 1, 2004 base price.)

Construction of the first cycle of cells in beneficial use sites PA 1A and PA 4A was completed in July 2006. Seeding and planting of the areas will be performed in the spring of 2007. Remaining construction is scheduled to be accomplished in the next 5 maintenance dredging cycles for the channel, which are every four years.

Local cooperation. The non-Federal sponsor for the project is Brazoria County Conservation and Reclamation District number 3. The Project Cooperation Agreement was executed September 13, 2005.

Operations during fiscal year. New Work: Plans and specifications were begun for FY09 construction in preparation for FY10 dredging. Sprigging of altheaflora was completed in April 2007. FY07 cost was \$31,372. Maintenance: Routine maintenance. (See Table 40-J for dredging operations.)

6. CORPUS CHRISTI SHIP CHANNEL, TX

Location. This project, formerly known as Port Aransas-Corpus Christi Waterway, Texas, was changed to Corpus Christi Ship Channel, Texas, by 1968 River and Harbor Act. This is a consolidation of old improvements of Port Aransas, Texas, and channel from Aransas Pass to Corpus Christi, Texas. Aransas Pass is on southern portion of Texas Coast, 180 miles southwest of Galveston and 132 miles north of mouth of Rio Grande. Aransas Pass connects Corpus Christi Bay with the gulf. Waterway extends from deep water in the gulf through Aransas Pass jettied entrance, thence westerly 20.75 miles to and including a turning basin at Corpus Christi, thence westerly 1.75 miles through Industrial Canal to and including turning basin at Avery

Point, thence westerly 4.25 miles to and including a turning basin near Tule Lake, thence northwesterly 1.8 miles to and including a turning basin at Viola, Texas. (See National Ocean Survey Charts 11308, 11309, 11311, and 11314.)

Previous project. For details see page 1861 of Annual Report for 1915.

Existing project. (See Table 40-H for existing project dimensions provided for in various channels and basins comprising this waterway.)

Project also provides for two rubblestone jetties at Aransas Pass entrance, extending into the gulf from St. Joseph and Mustang Islands, project lengths of which are 11,190 and 8,610 feet, respectively. Project further provides for a stone dike on St. Joseph Island about 20,991 feet long, connecting with north jetty and extending up this island to prevent a channel being cut around jetty. Project also provides for a breakwater at the entrance to the harbor area at Port Aransas, and for the realignment of the existing 12-foot by 100-foot project channel to Port Aransas. The breakwater consists of two overlapping sections. The one on the east side of the realigned entrance channel has a length of 830 feet and the second, located on the west side of the entrance channel, has a length of 1,290 feet. The channel to Port Aransas was relocated in the 300-foot clear distance between the overlapping sections. The portion of the channel remaining inside the breakwaters was widened to 150 feet. Under ordinary conditions, mean tidal range at Aransas Pass is about 1.1 feet and extreme range about 2 feet, and at Corpus Christi mean range about 1 foot and extreme about 1.5 feet. Heights of tides are dependent largely on strength and directions of winds, and during strong "northers" in the winter season water surface may be depressed as much as 3 feet below mean low tide. Estimated cost for new work is: Federal (Corps) \$74,938,515, including \$456,515 for Port Aransas Breakwaters and exclusive of amount expended on previous projects: and non-Federal \$18,977,431 (includes \$768 for Port Aransas Breakwaters) including \$7,644,435 contributed funds and value of useful work performed, \$3,320,228 lands, \$6,027,000 relocations and \$1,985,000 other cost. (October 1, 1992 base price.)

The Port Aransas-Corpus Christi 40-foot project was completed in 1966. The Jewel Fulton Canal was completed in 1963. The Port Aransas Breakwaters were completed in July 1973. Deepening deep-draft channels to 45 feet from Tule Lake Turning Basin through Viola Turning Basin was completed in 1989, and constructing a mooring area at Port Ingleside with dolphins has been deferred. Entrance and jetty channels have been dredged to project depth and width, and dredging of channel from Harbor Island to and through the Chemical Turning Basin at 45-foot depth has been completed.

Initial mooring dolphins were completed in May 1979. Disposal area levees, Area 1 and Rincon were completed in August 1984. First stage disposal area levees, South Shore, were completed in September 1984. Construction contract for mitigation terracing was completed in 1997. (See Table 40-G for total cost of existing project to September 30, 2007.)

Local cooperation. Fully complied with.

Terminal facilities. Terminal facilities on Harbor Island at head of Aransas Pass, Ingleside, Corpus Christi, La Quinta, Avery Point, and Viola, are considered adequate for existing commerce. (See Port Series, No. 25, revised 2003, Corps of Engineers.)

Operations during fiscal year. New Work: See Section 35, PRE-CONSTRUCTION ENGINEERING AND DESIGN. Maintenance: Routine maintenance (See Table 40-J for dredging operations.)

7. FREEPORT HARBOR, TX

Location. Formed by improvement of Brazos River, Texas, from mouth to about 6 miles upstream to Freeport, Texas. (See National Ocean Survey Charts 11321 and 11322.)

Previous projects. For details see page 1860 of Annual Report for 1915, and page 872 of Annual Report for 1938.

Existing project. Existing project dimensions for various channels and basins are shown in Table 40-H on channel dimensions at end of chapter.

Existing project also provides for dual jetties and a diversion canal for the Brazos River, including a dam, a lock in the dam and necessary auxiliary equipment. Also provides for rehabilitation of southwest jetty and the relocation of the northeast jetty (about 640 feet to the northeast); realignment of the channel between the Jetty Channel and Brazosport Turning Basin; realignment of the channel between Brazosport Turning Basin and Upper Turning Basin; relocation of Upper Turning Basin; and public use facilities adjacent to the Freeport Jetties. The 30-foot channel from Upper Turning Basin to Stauffer Chemical Plant, including the turning basin, was deauthorized by Sec. 12 of PL 93-251. Construction of lock in diversion dam at local expense is considered inactive.

The 38-36 foot project was completed in 1962. The 45-foot channel was completed in 1993 as follows: Relocation of the U. S. Coast Guard station was completed in May 1990; dredging the channel and turning basin to 36-feet and the Upper Turning Basin to 46-feet was completed in July 1990; dredging the jetty channel and the Lower Turning Basin was completed in November 1990; Construction of 3,700 feet of the North Jetty, was completed in March 1991; dredging the entrance channel was completed in April 1992;

dredging the Main channel, Brazosport turning basin and jetty channel was completed in June 1992; construction of public use facilities, and grading and stone protection was completed in August 1992; and rehabilitation of the south jetty and addition of 500-feet to the north jetty was completed in May 1993. Channel adjustments to a bend near the project's main turning basin were completed in 1998 to provide full utilization of the 45-foot channel. Construction of additional recreation features at Surfside by the Sponsor was completed in 2005. (See Table 40-G for total cost of existing project to September 30, 2007.)

Under ordinary conditions mean tidal range is about 1.5 feet and extreme range is about 2.5 feet. Except under extreme conditions, rises on river and in diversion channel do not cause greater variations in water surface than those caused by tidal action. Estimated cost of new work is: \$63,707,000 Federal (Corps) and \$470,000 Federal (USCG); and \$32,313,000 non-Federal, including \$21,302,000 contributed funds, \$300,000 contributed work, \$6,967,000 lands, \$3,174,000 levees and spillways, and \$570,000 relocations. (October 1, 1997 base price.)

Local cooperation. Fully complied with except for Section 101 of River and Harbor Act of 1970, under cost-sharing tenets of the Water Resources Development Act of 1986 and the Water Resources Development Act of 1996. Local Cooperation Agreement, executed June 26, 1986, along with Amendments 1, 2, 3, and 4 executed March 19, 1987; July 19, 1991; July 19, 1991; and July 15, 1997; respectively, require that local interest provide lands, easements, rights-of-way, including land for recreation, and dredged material disposal areas, presently estimated at \$10,141,000, modify or relocate utilities, roads, and other facilities, except railroad bridges, where necessary for construction of the project, presently estimated at \$570,000, contribute in cash one-half of the separable and joint costs allocated to recreation, presently estimated at \$530,000; and, during construction, pay 25 percent of the construction costs allocated to deep-draft navigation, including disposal facility construction, presently estimated at \$21,302,000.

Terminal facilities. Small privately owned wharves, two oil docks, one acid dock, two shell unloading docks and one caustic dock. Brazos River Navigation District has one large dock with four transit sheds over rail facilities permitting all-weather work. Facilities considered adequate for existing commerce. (See Port Series No. 26, revised 2002, for additional facilities.)

Operations during fiscal year. New Work: None Maintenance: Routine maintenance. (See Table 40-J for dredging operations.)

8. GALVESTON HARBOR AND CHANNEL, TX

Location. A consolidation of authorized improvements at Galveston, Texas, which includes projects formerly identified as Galveston Harbor, Texas; Galveston Channel, Texas; and Galveston seawall extension. Entrance to Galveston Harbor is on the Gulf of Mexico on the northern portion of the Texas Coast. Galveston Channel extends from a point in Galveston Harbor between Bolivar Peninsula and Fort Point to and along wharf front Galveston, Texas, and is about 5 miles long and 1,200 feet wide. (See National Ocean Survey Chart 11324/5.)

Previous projects. For details see page 1854 of Annual Report for 1915.

Existing project. Provides for channel dimensions in sections of the waterway shown in Table 40-H.

Also provided are: two rubble-mound jetties, the south one extending from Galveston Island and the north one extending from Bolivar Peninsula, for distances of 35,900 feet and 25,907 feet, respectively, into the Gulf of Mexico; a concrete seawall from the angle at Sixth Street and Broadway, in the city of Galveston, to the south jetty, and a 16,300-foot extension of the concrete seawall in a southwesterly direction from 61st Street; for 11 groins along the gulf shore between 12th Street and 61st Street; and for maintenance of seawall from the angle at 6th Street and Broadway to the south jetty. Under ordinary conditions, mean tidal range in Galveston Harbor is 1.6 feet on outer bar and 1.4 feet on inner bar with extreme ranges of 2.3 and 2.1 feet, respectively. Mean range in Galveston channel is about 1.3 feet and extreme range about 2 feet under ordinary conditions. Height of tides in both Galveston harbor and channel is dependent largely on the wind, and during strong "northers" water surface may be depressed 2 feet below mean low tide.

Existing project is complete. Dredging of Galveston channel to 36-foot depth was completed in November 1966. Dredging of the realigned entrance and Outer Bar Channel was completed in October 1967. Rehabilitation of the Beach Front Groins was completed June 1970. Dredging of Galveston channel to 40 feet was completed in March 1976. See Section 15. TEXAS CITY CHANNEL, TX regarding work authorized by Water Resources Development Act of 1986, Section 11, HOUSTON-GALVESTON NAVIGATION CHANNELS, TX, for work authorized by the Water Resources Development Act of 1996. (See Table 40-G for total cost of existing project to September 30, 2007.)

Local cooperation. Complied with.

Terminal facilities. None on Galveston Harbor, which is entrance channel leading to terminal facilities on Galveston, Texas City, and Houston Ship Channels.

Galveston Channel terminal facilities are mostly on south side of channel. Principal wharves, owned by the city of Galveston, extend from 10th to 41st Street (see Port Series No. 23, revised 2006.) A container ship terminal equipped with a crane capable of stacking containers three units high on the deck of any normal container ship has been completed and placed into operation by the city of Galveston at Piers 10 and 11, on the south side of Galveston Channel. The city of Galveston has also placed into operation a barge terminal equipped with two 35-ton and one 5-ton cranes for loading and unloading barges on Lash and Seabee ships at Pier 35 and a docking and holding area for Lash and Seabee barges on Pelican Island, directly across the channel from Piers 35 and 36. Present facilities are considered adequate for existing commerce.

Operations during fiscal year. New Work: Also see Section 10, HOUSTON-GALVESTON NAVIGATION CHANNELS, TX. Maintenance: Routine Maintenance (See Table 40-J for dredging operations.)

9. GULF INTRACOASTAL WATERWAY BETWEEN APALACHEE BAY, FL, AND THE MEXICAN BORDER

Location. Extends from a point on Sabine River about 3 miles below Orange, Texas, to Brownsville, Texas, about 421 miles; a navigation channel, about 7 miles long, in Colorado River, extending from Matagorda, Texas, to Gulf of Mexico; a tributary channel in San Bernard River, extending from Intracoastal Waterway crossing to State highway bridge some 30 miles above crossing; a tributary channel in Colorado River extending from Intracoastal Waterway upstream 15.5 miles; a tributary channel extending about 14 miles from Intracoastal Waterway to Palacios, Texas; a tributary channel extending about 2 miles from Intracoastal Waterway to Rockport, Texas; a tributary channel extending about 6 miles from Intracoastal Waterway near Port Aransas, Texas, to town of Aransas Pass, Texas; a tributary channel about one-fourth mile long extending from Intracoastal Waterway near Port O'Connor, Texas, into Barroom Bay; a tributary channel extending about 38.8 miles from Intracoastal Waterway via Seadrift to a point in Guadalupe River 5.5 miles below Victoria, Texas; a harbor of refuge for small craft at Seadrift; a channel extending from gulf to Port Mansfield, Texas, about 11 miles; and a tributary channel in Arroyo, Colorado extending from Intracoastal Waterway to a point near Harlingen, Texas, about 31 miles; side channels in vicinity of Port Isabel, Texas, and a small boat basin at Port Isabel, Texas, and a tributary channel extending from Intracoastal Waterway main channel at a point in West Galveston

Bay into Offatts Bayou about 2.2 miles with a west turnout (weye connection) 12 feet deep and 125 feet wide between Offatts Bayou Channel and the Gulf Intracoastal Waterway. (See National Ocean Survey Charts 11302, 11303, 11305, 11306, 11308, 11309, 11314, 11315, 11317, 11319, 11322, 11326, and 11331.)

Previous project. For details see page 1859 of Annual Report for 1915. (West Galveston Bay and Brazos River Canal, Texas.)

Existing project. Existing project dimensions provided for in main channel of waterway: A channel 12 feet deep (below mean low tide) and 125 feet wide from the Sabine River to Brownsville, Texas. Relocation of channel 12 feet deep by 125 feet wide in Matagorda Bay, miles 454.3 to 471.3, relocation of channel 12 feet deep by 125 feet wide in Corpus Christi Bay, miles 539.4 to 549.7 (mileage is west of Harvey Lock, Louisiana); and alternate channel, 12 feet deep (below mean low tide) and 125 feet wide via Galveston Channel and Galveston Bay to the Galveston causeway; maintenance of existing channel 12 feet deep by 125 feet wide through Lydia Ann Channel, between Aransas Bay and Aransas Pass; provisions of such passing places, widening of bends, locks and guard locks, railway bridges over artificial cuts as are necessary, and the tributary channels shown in tabulation. The authorized channel 16 feet deep and 125 feet wide from Sabine River to Houston Ship Channel is inactive. (See Table 40-I on existing project dimensions provided for in tributary channels.)

Removal of the railroad bridge across the canal at Mud Bayou was completed and operation and care of the facility was discontinued on April 14, 1969. Deepening the existing 6 foot by 60 foot side channels at Port Isabel to 12 feet was completed February 22, 1972, Offatts Bayou channel was completed January 1974. Relocation of main channel across Corpus Christi Bay was completed in September 1976. The 14-foot by 175 foot Channel to Aransas Pass was completed in April 1979. Dredging Chocolate Bayou Channel was completed in January 1981. Construction of a saltwater barrier in Chocolate Bayou was completed in February 1981. The 12-foot by 125-foot channel relocation route in Matagorda Bay has been de-authorized. The Harbor of Refuge at Seadrift, Texas, has been placed in the inactive category.

Mean tidal variation is 0.5 foot at Orange, 1 foot at Port Arthur, 1.3 feet in Galveston Bay, 1.5 feet at Freeport, 1 foot in Matagorda Bay, 1 foot in San Antonio Bay, 1 foot at Corpus Christi, 1.5 feet at Port Isabel, and 1.5 feet at Brownsville. Extreme ranges of tide under ordinary conditions are 1 foot at Orange, 1.5 feet at Port Arthur, 2 feet in Galveston Bay, 2 feet at Freeport, 1.5 feet in Matagorda and San Antonio Bays,

1.5 feet at Corpus Christi, 2 feet at Port Isabel, and 1.5 feet at Brownsville. Height of tides is dependent largely on wind. Strong north winds have depressed water surface as much as 2 feet below mean low tide.

Mouth of Colorado River: Construction of jetties at mouth of Colorado River was completed in 1986. Construction of a navigation channel from the Gulf to the GIWW and an impoundment basin were completed in 1991. Construction of Tiger Island Dam and recreation facilities were also completed in 1991. Construction of the recreation facilities at Jetty Park was completed in 1992. Construction of the diversion dam and connecting channel was completed in 1993. Construction of the oyster cultch was completed in 1995.

Brazos River Floodgates- Major Rehabilitation: Major rehabilitation of the East Floodgate Guidewalls was completed in 1997. The cost of rehabilitation was \$2,750,000 Federal (Corps) and \$2,750,000 Federal (Inland Waterways Trust Fund).

Sargent Beach: Work authorized by the Water Resources Development Act of 1992 for construction of a concrete-pile and concrete block revetment structure, which extends 8 miles to protect the Gulf Intracoastal Waterway was completed in 1998. Construction cost was \$29,460,000 Federal (Corps) and \$29,460,000 Federal (Inland Waterways Trust Fund).

Aransas National Wildlife Refuge: Work authorized by the Water Resources Development Act of 1996 provides for erosion protection and limited spill containment for the existing alignment of the Gulf Intracoastal Waterway and includes marsh creation with beneficial uses of dredged material along a 31-mile reach of the waterway which crosses the critical wintering habitat of the rare and endangered whooping crane, including a 13.25 mile reach within the boundary of the Aransas National Wildlife Refuge. This area is located approximately 35 miles northeast of Corpus Christi, Texas in Aransas and Calhoun Counties. The project was completed in 2001. Construction costs were \$14,123,500 Federal (Corps).

Work remaining:

Active authorized work remaining consists of the work authorized by the Water Resources Development Act of 1988 for enlarging the existing Channel to Victoria from a depth of 9 feet and width of 100 feet to a depth of 12 feet and width of 125 feet. (See Table 40-G for total cost of existing project to September 30, 2007.)

Estimated cost for new work is:

Channel to Victoria - \$31,686,000 Federal (Corps), \$422,000 Federal (Department of Transportation), \$62,000 Federal (U.S. Coast Guard), and \$6,530,000 non-Federal consisting of \$3,521,000

cash, \$1,646,000 lands, and \$1,363,000 levees and other associated costs. (October 1, 2002 base price.)

Local cooperation. Fully complied with except for provisions of Section 101, 1968 River and Harbor Act and Water Resources Development Act of 1988. The Project Cooperation Agreement for Channel to Victoria was executed November 17, 1994.

Terminal facilities. There are terminal facilities at Aransas Pass, Port Arthur, Galveston, Port Isabel, and Brownsville. See Port Series No. 22 (revised 2001), Port Series No. 23 (revised 2006), Port Series No. 25 (revised 2003) and Port Series No. 26 (revised 2002), Corps of Engineers. Local interests constructed terminal facilities at Port Mansfield and Port Harlingen. There are numerous privately owned piers and wharves along the waterway. A 330-foot navigation district owned general cargo dock, a 770-foot private dock and a 760-foot private timber trestle have recently been completed at the upper end of the Channel to Victoria. Facilities are adequate for existing commerce.

Operations during fiscal year.

New Work: -

Channel to Victoria - Construction contract for Reach 3, awarded in FY00 was financially closed out in February of 2007 at a final cost of \$37,678

Maintenance: -.

Main Channel and Tributaries -

(See Table 40-J for dredging operations.)

Aransas National Wildlife Refuge - No maintenance performed during the fiscal year.

Brazos River Floodgates - The Brazos River Floodgates were operated and maintained at a cost of \$1,473,376.

Channel to Victoria - Routine maintenance. (See Table 40-J for dredging operations.)

Colorado River Locks - The Colorado River Locks were operated and maintained at a cost of \$1,663,002.

Channel to Port Mansfield - No maintenance performed during the fiscal year.

Chocolate Bayou - Routine maintenance. (See operations Table 40-J for dredging.)

Mouth of Colorado River - No maintenance required during the fiscal year.

10. HOUSTON-GALVESTON NAVIGATION CHANNELS, TX

Location. Houston Ship Channel connects Galveston Harbor, at a point opposite Port Bolivar, with city of Houston, Texas, extending 50 miles northwesterly across Galveston Bay through San Jacinto

River and Buffalo Bayou to a turning basin at head of Long Reach with light-draft channel 5 miles long from turning basin to Jensen Drive, Houston. The entrance to Galveston Harbor and Channel is on Gulf of Mexico on the northern portion of the Texas Coast. Galveston Channel extends from a point in Galveston Harbor between Bolivar Peninsula and Fort Point to and along wharf from Galveston, Texas and is about 5 miles long and 1,200 feet wide. (See National Ocean Survey Charts 11324/5, 11327, 11328, and 11329.)

Existing project. See Section 8, GALVESTON HARBOR AND CHANNEL, TX and Section 12, HOUSTON SHIP CHANNEL, TX for project prior to October 1998. New authorized project provides for enlarging the Houston Ship Channel to a depth of 45 feet and a width of 530 feet. The Galveston Channel will be enlarged to a depth of 45 feet over a width which varies between 650 and 1,112 feet, and deepening the Galveston Harbor Channel to 47 feet (45-foot authorized and 2 feet for dredging inaccuracies and wind impact) over its original 800-foot width and 10.5 mile length; and extending the channel an additional 3.9 miles to the 47-foot bottom contour in the Gulf of Mexico along existing alignment. A dredged-material disposal plan, which would utilize confined or beneficial uses of dredged material in the bay and/or offshore disposal and 118 acres of Oyster mitigation is also provided in the project.

Energy and Water Development Appropriations Act of 2001, Section 1(a)(2) of Public Law 106-377 authorized construction of barge lanes. Barge lanes will be constructed on the sides of the Houston Ship Channel to a depth of 12 feet and a distance of 500 feet from the centerline of the channel from Bolivar Roads to Morgan's Point, a distance of approximately 26 miles. Fifty-four acres of oyster reef will be impacted and will be mitigated.

Estimated cost for new work is: \$510,024,000 Federal (Corps) which includes \$311,160,000 for general navigation features and \$94,787,000 for environmental restoration of which \$104,078,000 is for deferred environmental construction; \$7,203,000 Federal (U.S. Coast Guard); and \$179,072,000 non-Federal consisting of \$101,078,000 cash, \$1,123,000 lands, and \$65,000 relocations for general navigation features; \$10,518,000 for berthing areas; and \$66,288,000 cash for environmental restoration which includes \$34,693,000 for deferred environmental construction. (October 1, 2007 base price.)

The first construction contract to dredge the Entrance Channel Extension, awarded 1998, was completed in 1999. The contract for dredging the entrance channel and jetty area was completed in March 2000. The Oyster Reef Mitigation for the main channel was completed in 2000. Construction of the Lower Bay

reach was completed in 2001. A contract for Mid Bay was awarded 2001 and work was completed on 2004. The construction contract for Redfish Island was awarded 2002 and construction was completed 2002. A contract for Mid Bayou (Goat Island) was awarded 2002, and work was completed 2005. The Lower Bayou contract work was completed on 2003. The Upper Bay & Barge Lane contract was completed in 2005. The Barge Lane Mitigation contract was completed on 2005. The Houston Ship Channel and entrance channel was opened to allow vessels drawing 45-foot of water on 2005. A considerable amount of shoaling has been experienced in the channel since opening and the construction efforts now focus on establishing 20-year capacity at the existing sites.

Remaining work includes construction to increase capacities in Placement Areas, deepen Galveston Channel, and environmental restoration features along the Houston Ship Channel.

Local cooperation. Complied for the completed work. For the Houston-Galveston Navigation Channels project, authorized by the Water Resources Development Act of 1996, the cost-sharing and financing concepts reflected in the Water Resources Development Act of 1986, as amended, apply. Local interests are required to provide lands, easements, rights-of-way, roads and other facilities, except railroad bridges; pay one-half of the separable and joint costs allocated to recreation; and pay 25 percent of the costs allocated to deep-draft navigation, during construction including in-kind work in connection with construction; and pay an additional 10 percent of the costs allocated to navigation within a period of 30 years following completion if not offset by credit allowed for lands, easements, rights-of-way, and relocations.

The Port of Houston Authority and the City of Galveston are the sponsors for the project. A Project Cooperation Agreement with the Port of Houston Authority was executed on June 10, 1998. The Project Cooperation Agreement with the City of Galveston was executed on June 21, 2007.

Terminal facilities. See Section 8, GALVESTON HARBOR AND CHANNEL, TX and Section 10, HOUSTON SHIP CHANNEL, TX.

Operations during fiscal year. New Work: The construction contract for the Upper Bay and Barge Lanes was financially closed out at a cost of \$699,002 in FY07. The Morgan's to Exxon (1st Maintenance) contract awarded April 27, 2006 continued through FY07. Cost incurred for FY07 was \$1,581,786. The Redfish to Morgan's (1st Maintenance) contract awarded June 30, 2006 continued through FY07. Cost incurred for FY07 was \$4,475,757. The Spilman Island Levee Work contract awarded September 19, 2006 continued through FY07. Cost incurred for FY07 was \$6,185,473.

The Peggy Lake contract awarded August 22, 2006 continued through FY07. Cost incurred for FY07 was \$2,119,158. The Multiple Placement Area Shoreline Repair contract awarded September 22, 2006 continued through FY07. Cost incurred for FY07 was \$4,516,138. The Lost Lake Capacity contract awarded June 14, 2007 continued through FY07. Cost incurred for FY07 was \$1,850,617.

Maintenance: See Section 8, GALVESTON HARBOR AND CHANNEL, TX and Section 10, HOUSTON SHIP CHANNEL, TX for maintenance of existing channels. (See Table 40-J for dredging operations.)

11. HOUSTON SHIP CHANNEL, TX

Location. Houston Ship Channel connects Galveston Harbor, at a point opposite Port Bolivar, with city of Houston, Texas, extending 50 miles northwesterly across Galveston Bay through San Jacinto River and Buffalo Bayou to a turning basin at head of Long Reach with light-draft channel 5 miles long from turning basin to Jensen Drive, Houston. (See National Ocean Survey Charts 11324/5, 11327, 11328, and 11329.)

Previous project. For details see page 1856 of Annual Report for 1915.

Existing project. Provides for channel dimensions in sections of the waterway shown in Table 40-H.

Also provides for certain cut-offs, for easing sharp bends, an earthen dam across the upper end of Turkey Bend, and for off-channel silting basins as deemed necessary by the Chief of Engineers. Construction of 26,000 linear feet of pile dike to protect the channel in upper Galveston Bay was de-authorized by Sec. 12 of PL 93-251. The 40-foot project was completed in March 1966. Dredging a channel in Greens Bayou to Mile 1.57 was completed in 1970. Dredging Greens Bayou, Mile 1.57 to Mile 2.73, has been de-authorized. See Section 10, HOUSTON-GALVESTON NAVIGATION CHANNELS, TX for work authorized by the Water Resources Development Act of 1996. (See Table 40-G for total cost of existing project to September 30, 2007.)

Mean tidal range under ordinary conditions is 0.6 foot to 1.3 feet in lower part of Galveston Bay; 0.6 foot to 1.3 feet in upper bay; and 0.5 to 1 foot in San Jacinto River and Buffalo Bayou. Extreme ranges under ordinary conditions are about 2 feet, 1.2 feet and 1 foot, respectively. Freshets caused rises of over 12 feet in Buffalo Bayou; however, this condition has not occurred since completion of Addicks and Barker Dams for flood control on upper watershed of Buffalo Bayou. Height of tides is dependent largely on the wind, and during strong "northers" in winter season, the water surface may be depressed 2 feet below mean low tide.

Local cooperation. Fully complied with for Houston Ship Channel. Local Cooperation Agreement for assumption of maintenance on Bayport Ship Channel was executed April 6, 1993. Local Cooperation Agreements for assumption of maintenance on Barbour Terminal Channel and Greens Bayou Channel were both executed on February 8, 1994.

Terminal facilities. City of Houston and Port of Houston Authority operate modern terminals which supplement privately owned wharves, piers, and docks, as described in Port Series No. 24 (revised 1999), Corps of Engineers. Facilities are considered adequate for existing commerce.

Operations during fiscal year. New Work: See Section 10, HOUSTON-GALVESTON NAVIGATION CHANNELS, TX. Maintenance: Routine dredging maintenance. (See Table 40-J for dredging operations.) Also, see Section 11, HOUSTON-GALVESTON NAVIGATION CHANNELS, TX.

12. MATAGORDA SHIP CHANNEL, TX

Location. This is a consolidation of shallow draft channel improvements of "Channel from Pass Cavallo to Port Lavaca, Texas," and deep draft channel improvements authorized under "Matagorda Ship Channel, Texas." Bar at Pass Cavallo is 125 miles southwest of Galveston entrance and 54 miles north of Aransas Pass. It connects Matagorda Bay with the gulf. Project extends across Matagorda Bay and Lavaca Bay to towns of Port Lavaca and Point Comfort. These two towns are on opposite sides of Lavaca Bay and both are about 26 miles northwest from Pass Cavallo. (See National Ocean Survey Chart 11316.)

Existing project. Existing project dimensions provided for in various channels and basins are listed in Table 40-H on channel dimensions.

Project also provides for dual jetties at entrance, south jetty extending 6,000 feet to 24-foot depth in the gulf and north jetty extending 5,900 feet to 24-foot depth. Under ordinary conditions mean tidal range is about 1 foot and extreme range about 2 feet. Height of tide is dependent largely on the wind, and during strong "northers" in the winter season, the water surface may be depressed 2 feet below mean low tide. (See Table 40-G for total cost of existing project to September 30, 2007.)

Local cooperation. Fully complied with.

Terminal facilities. Privately owned facilities at Port Lavaca, municipally owned facilities at mouth of Lynn bayou, privately owned and publicly owned facilities at Point Comfort, Texas. These facilities are considered adequate for present commerce. Facilities at Point Comfort consist of a channel, turning basin with

wharfs, oil dock and loading equipment, all owned by Aluminum Company of America; and a wharf built by local interest at Point Comfort turning basin.

Operations during fiscal year. Maintenance: Routine maintenance. (See Table 40-J for dredging operations.)

13. NECHES RIVER AND TRIBUTARIES, SALT WATER BARRIER AT BEAUMONT TX

Location. The project is located just below the Big Thicket National Preserve and the confluence of Pine Island Bayou and the Neches River at Beaumont, Texas, in Jefferson and Orange Counties on the upper coast of Texas. (See National Ocean Survey Chart 11343.)

Existing project. The project will provide for an overflow dam in the Neches River, a gated salt water barrier consisting of five 56 feet by 24.5 feet tainter gates; a gated navigation bypass channel with a clear opening of 56 feet and a depth of 16 feet; an access road and levee; and an auxiliary dam across a canal which drains an adjacent bayou. Estimated cost for new work is \$43,064,000 Federal (Corps) and \$14,355,000 non-Federal consisting of \$8,435,000 contributed funds, \$1,800,000 for lands, \$4,120,000 for relocations. (October 1, 2002 base price.)

The project was authorized for construction in the Water Resources Development Act of 1976 (Sec. 102, PL 94-587). The construction contract was awarded September 18, 2000 and completed in 2004.

Local cooperation. Non Federal Sponsor for the project is the Lower Neches Valley Authority. Report of the Chief of Engineers for the Water Resources Development Act of 1976 authorization cited a 1974 Waterways Experiment Station report, which concluded that 75 percent of the salinity in the Neches River at Beaumont was due to the Federal deep draft navigation project to Beaumont and 25 percent was due to withdrawals by water users. From 1994 to 1996, the Corps reevaluated the project which resulted in a May 1997 decision by the Assistant Secretary of the Army (Civil Works), to direct that the project go forward with 75 percent Federal / 25 percent non-Federal cost-sharing as a navigation mitigation project. In October 1999, the Assistant Secretary of the Army (Civil Works) issued a decision stating that operations and maintenance will also be cost-shared as 75 percent Federal and 25 percent non-Federal. A Project Cooperation Agreement was executed on May 22, 2000.

Terminal facilities. None.

Operations During Fiscal Year. New Work: None Maintenance: See Section 14, SABINE-NECHES WATERWAY, TX Operations during the fiscal year for

the reimbursement to Lower Neches Valley Authority for the federal share of the operations cost

14. SABINE-NECHES WATERWAY, TX

Location. This is a consolidation of old improvements of "Harbor at Sabine Pass and Port Arthur Canal" and "Sabine-Neches Canal, including Sabine River to Orange and Neches River to Beaumont, Texas." Sabine Pass is on Gulf of Mexico about 58 miles east of Galveston and 280 miles west of Southwest Pass, Mississippi River. It connects Sabine Lake with gulf. Port Arthur canal extends 7 miles from near upper end of Sabine Pass to Port Arthur docks at mouth of Taylors Bayou. Near its upper end, Sabine-Neches canal joins and extends to mouths of Neches and Sabine Rivers. Waterway next extends up Neches River to Beaumont and up Sabine River to Orange. (See National Ocean Survey Charts 11341, 11342, and 11343.)

Previous projects. For details see page 1863 of Annual Report for 1915, page 985 of Annual Report for 1916, and page 873 of Annual Report for 1926.

Existing project. Existing project dimensions provided for in various channels and basins are set forth in Table 40-H on channel dimensions. Project also provides for two stone jetties at Sabine Pass entrance from the gulf, western jetty to be 21,905 feet long and eastern jetty 25,310 feet long. Project further provides for removal of guard lock in Sabine-Neches Canal, construction of suitable permanent protective works along Sabine Lake frontage owned by city of Port Arthur to prevent dredged material from entering Sabine Lake and to prevent erosion of material deposited, reconstruction of Port Arthur Bridge, and relocation of Port Arthur field office.

Mean tidal variation at entrance is about 1.5 feet, at Port Arthur about 1 foot, and at Orange and Beaumont about 0.5 foot. Prolonged north winds during winter season have depressed water surface as much as 3.4 feet below mean low tide while tropical disturbances have caused heights as much as 8 feet above mean low tide.

Existing project is complete. Removal of obstructive bridge at Port Arthur was completed May 1969. The high level fixed bridge across Sabine-Neches Canal was completed October 1970. Deepening project to 40 feet was completed April 1972. (See Table 40-G for total cost of existing project to September 30, 2007.)

Local cooperation. Complied with.

Terminal facilities. See volume 2, Port Series No. 22 (revised 2001), Corps of Engineers. Facilities are considered adequate for present commerce.

Operations during fiscal year. Maintenance: The Lower Neches Valley Authority was reimbursed

\$294,206 in Fiscal Year 07 for the Federal share of the operations cost for the Neches River and Tributaries, Saltwater Barrier at Beaumont. Construction contract awarded June 30, 2006, Repair East Jetty at Sabine, continued through FY07 at a fiscal year cost of \$2,358,179. Construction contract awarded June 27, 2006 for repair to Placement Area No. 11 was completed in FY07 for a fiscal year cost of \$8,012,530. (See Table 40-J for dredging operations.)

15. TEXAS CITY CHANNEL, TX

Location. Texas City is on the mainland of Texas on west side of Galveston Bay, about 10 miles northwest of city of Galveston. (See National Ocean Survey Charts 11324/5.)

Previous projects. For details see page 1856 of Annual Report for 1915.

Existing project. Provides for channel 40 feet deep, 400 feet wide and about 6.75 miles long, from Bolivar Roads to a turning basin at Texas City, 40 feet deep, 1,000 feet to 1,200 feet wide and 4,253 feet long; and an Industrial Canal, 40 feet deep and 300-400 feet wide extending a distance of 1.7 miles southwestward from the south end of Texas City Turning Basin, and a turning basin, 40 feet deep, 1,000 feet wide and 1,150 feet long.

Project also provides for easing the approach to the turning basin; a pile dike 28,200 feet long, parallel to and north of the channel; and a rubble-mound dike, 27,600 feet long, along the southerly side of the pile dike.

The 40-foot channel was completed in June 1967. Widening the Texas City Turning Basin; realigning the Texas City Turning Basin to a location 85 feet easterly from its present position; and enlargement through widening and deepening of the Industrial Canal and basins was initiated in July 1980 and completed in June 1982. The only work remaining is deferred construction consisting of widening the Industrial Canal from 250 feet to 300 feet at 40 foot depth.

Work authorized by Water Resources Development Act of 1986 would modify the project by providing for deepening the Texas City Turning Basin to 50 feet, enlarging the 6.7-mile long Texas City Channel to 50 feet by 600 feet, deepening the existing 800-foot wide Bolivar Roads Channel and Inner Bar Channel to 50 feet, deepening the existing 800-foot wide Outer Bar and Galveston Entrance Channel to a 52-foot depth for 4.1 miles at a width of 800 feet and an additional reach at a width of 600 feet to the 52 foot contour in the Gulf of Mexico. Establishment of 600 acres of wetland and development of water-oriented recreational facilities on a 90-acre enlargement of the Texas City Dike are also proposed. The project is currently under reevaluation.

(See Table 40-G for total cost of existing project to September 30, 2007.)

Under ordinary conditions mean tidal range is about 1.3 feet and extreme range is about 2 feet. Height of tide is dependent largely on the wind and during strong “northers” water surface may be depressed 2 feet below mean low tide.

Estimated cost for new work is \$123,300,000 Federal (Corps), excluding expenditures on previous projects, and \$74,393,700 non-Federal, including \$62,027,741 contributed funds, \$248,000 work contribution, \$427,959 lands, \$10,737,000 levees and spillways, \$6,000 for removal of barge mooring facilities from Shoal Point (formerly known as Snake Island), \$561,000 for berthing areas, and \$386,000 relocations. (October 1, 1988 base price.)

Local cooperation. Fully complied with for completed work. For work authorized by the Water Resources Development Act of 1986, as amended, local interests are required to provide lands, easements, rights-of-way, and disposal areas; relocate utilities, roads, and other facilities, except railroad bridges; provide berthing areas; pay one-half of the separable and joint costs allocated to recreation; and bear all costs of operation, maintenance and replacement of recreation facilities, and, during construction, pay 25 percent of the costs allocated to deep-draft navigation to a depth of 45 feet plus 50 percent of the costs allocated to deep-draft navigation deeper than 45 feet; pay an additional 10 percent of the costs allocated to deep-draft navigation within a period of 30 years following completion if not offset by credit allowed for lands, easements, rights-of-way, relocations and disposal areas; and pay 50 percent of the costs incurred for operation and maintenance below the 45-foot depth.

Terminal facilities. Privately owned terminal facilities are on the mainland at inner end of this channel and are considered adequate for existing commerce. A deep-draft channel and turning basin extend about 1.9 miles southwestward from south end of Texas City Turning Basin have been constructed by local interests. See Port Series No. 23 (revised 2006), Corps of Engineers.

Operations during fiscal year. New Work: See Section 35, PRE-CONSTRUCTION ENGINEERING AND DESIGN. Maintenance: Routine Maintenance. Construction contract for dewatering Placement Areas 5 and 6 at Shoal Point was awarded April 27, 2007 and continued through the year at a fiscal year cost of \$457,746. (See Table 40-J for dredging operations.)

16. TRINITY RIVER AND TRIBUTARIES, TX

Location. The main stem of the Trinity River is formed at Dallas by the confluence of the West Fork and the Elm Fork at river mile 505.5. The mouth of the Trinity is about one-half mile west of Anahuac, Texas. (See Geological Survey base map, Texas, scale 1:500,000.)

Previous project. For details of abandoned locks and dam construction see page 986 of Annual Report for 1933.

Existing project. See individual detailed reports on Anahuac Channel, Channel to Liberty and Wallisville Lake. Project includes the existing Federal project designated as “Mouth of Trinity River, Texas,” which was completed in 1907 at a cost of \$80,000 (no cost to local interest). Project is not being maintained. (See Table 40-G for total cost of existing project to September 30, 2007.)

Local cooperation. See individual detailed reports on Channel to Liberty and Wallisville Lake. There is no local cooperation required for Anahuac Channel.

Terminal facilities. Privately owned wharves and piers at Anahuac, Moss Bluff, Wallisville, and Liberty, Texas, are adequate for existing commerce.

16A. ANAHUAC CHANNEL, TX

Location: Extends from 6-foot depth in Galveston Bay to Anahuac, Texas, opposite mouth of Trinity River 38 miles north of Galveston, Texas. (See National Ocean Survey Chart 11323.)

Existing project. No project dimensions authorized by 1905 River and Harbor Act. A 6- by 80-foot channel, 16,000 feet long was dredged in 1905. At present a 6 by 100-foot channel is maintained. Under ordinary conditions tidal range is 0.6 to 1.2 feet. Height of tide is dependent largely on wind. Strong north winds depress water surface 1.5 feet below mean sea level. Latest published map is in House Document 440, 56th Congress, 1st Session. Project was completed in 1911.

Local cooperation. None required.

Terminal facilities. Privately owned wharves and piers are the only terminal facilities at Anahuac.

Operations during fiscal year. Maintenance: No maintenance was performed during the fiscal year.

16B. CHANNEL TO LIBERTY, TX

Location. Improvement is located in Galveston Bay and tidal reach of lower Trinity River. (See Geological Survey Maps for Anahuac, Cove, Moss Bluff, and Liberty, Texas.)

Previous projects. For details see page 986 of Annual Report for 1932.

Existing project. Provides for a 6-foot channel from Anahuac to Liberty, which was completed in 1925.

A navigable channel from the Houston Ship Channel near Red Fish Bar in Galveston Bay to Liberty, Texas, with depth of 9 feet and width of 150 feet, extending along the east shore of Trinity Bay to the mouth of the Trinity River at Anahuac, thence in the river channel to a turning basin at Liberty, Texas, and a protective embankment along the west side of the channel in Trinity Bay.

The 6-foot Channel to Liberty was completed in 1925. The 9-foot Channel to Liberty has been dredged from junction with Houston Ship Channel to a point one mile below Anahuac, Texas. Work remaining consists of dredging a 9- by 150-foot channel from one mile below Anahuac, Texas to Liberty, Texas.

Local cooperation. Fully complied with for portion of "Channel to Liberty" between Houston Ship Channel and 1 mile below Anahuac, Texas, as required by 1946 River and Harbor Act (H. Doc. 634, 79th Cong., 2nd Sess.), but not complied with for remaining portion of "Channel to Liberty" as required by River and Harbor Act of 1945 (H. Doc. 403, 77th Cong., 1st Sess.).

Terminal facilities. Privately owned wharves and docks at Anahuac, Wallisville, Texas Gulf Sulphur Co.'s slip, Moss Bluff and Liberty, Texas, are adequate for existing commerce.

Operations during fiscal year. Maintenance: No maintenance performed during the fiscal year.

16C. WALLISVILLE LAKE, TX

Location. Dam is at river mile 3.9, about 4 miles northwest of Anahuac, Texas. (See National Ocean Survey Chart 11323.)

Existing project. Provides for construction of a dam and overflow spillway approximately 8 miles long to prevent salinity intrusion and create a 3,800 acre reservoir. The maximum pool elevation will be 2 feet above National Geodetic Vertical Datum. (The reservoir was reduced from 5600 acres with a maximum pool elevation of 4 feet N.G.V.D. by agreement to protect the endangered bald eagle.) Project provides for an 84 foot by 600-foot navigation lock to facilitate navigation on Channel to Liberty. The sill has a depth of minus 16 feet below National Geodetic Vertical Datum. Project also provides for two recreational areas; and three water control structures to control salinity intrusion and regulate freshwater flows to the saltwater marsh west of the river. Dam controls a drainage area of 1,262 square miles below Livingston Dam (non-Federal project at channel mile 99.2) and has a storage capacity of 14,000 acre-feet. Under ordinary conditions mean tidal range in bay is from 0.6 foot to 1.2 feet. Height of tide is dependent largely on wind. Strong northerly winds depress water surface 1.5 feet below mean sea level. Total estimated cost of authorized project is

\$81,200,000 Federal (Corps). (October 1, 2000 base price.)

A contract for construction of access road, Big Hog intake structure, intake canal and access bridge was completed in October 1968. Work started in July 1970 on construction of the lock and dam, roads, diversion channel, and navigation channel. Work was suspended in February 1973 because of an injunction halting construction. Protective work on the lock and dam was permitted and was completed in April 1973. An exception to the injunction was granted for plugging oil wells, which was completed in August 1973. Notice of appeal to the Court of Appeals for the Fifth Circuit was filed in April 1973. In August 1974, the Court of Appeals reversed the judgment and remanded the case with directions that a revised or supplemental statement be prepared and judged anew. Final supplement to the Environmental Impact Statement for the modified project authorized in the Supplemental Appropriations Act, 1983 (PL 98-63) was submitted to the Environmental Protection Agency on September 21, 1983.

In March 1986, the Court rendered its Memorandum of order continuing the injunction and directing the Corps to recommence the administrative process at the time when the first departure from standard NEPA procedures occurred prior to the 1983 legislative action. The Corps and Non-Federal Sponsors perfected an appeal to the U.S. Court of Appeals and on May 11, 1987, the Court of Appeals ruled in favor of the Corps and dismissed the suit in its entirety.

The Energy and Water Development Appropriation Act of 1991 provided \$9,200,000 for the project and directive language for continuation of construction.

In the fall of 1989, a pair of bald eagles was discovered nesting at the project site, which led to additional consultation under the Endangered Species Act. Solicitation of the contract for the non-overflow dam was postponed to allow for environmental coordination. An Environmental Assessment was prepared with a Finding of No Significant Impact (FONSI), which was signed in September 1991. Environmental documents were approved and construction was resumed.

A contract to rehabilitate and complete the navigation lock, complete the North and South navigation channels, construct a new administrative/resident office building, and electrical and mechanical equipment controls for the controlled spillway structure was awarded in December 1995 and completed in FY 99. A dedication ceremony for the Wallisville Lake Project was held on November 1, 1999.

Construction of Control Structure A was completed in February 2000 and Cedar Hill Park was completed in

October 2000. In 2001 remediation of the abandoned dam, removal of skimmers, repairs to the West-Non-Overflow dam and construction of public-use facilities were completed.

Site improvements consisting of replacement of timbers, construction of a boat ramp and dock, new fencing, walkways and improvements to parking lots were completed in 2003.

The Wallisville Lake Project was turned over for permanent operations at the beginning of FY 00. The project's construction was completed in 2003.

Local cooperation. Local interest must contribute an amount equal to cost allocated to water supply, one-half of cost allocated to salinity control and cost allocated to recreation less cost of basic facilities and less 15 percent of total project cost. Local interest reimbursement is estimated at \$12,200,000.

Operations during fiscal year. New Work: None
Maintenance: a contract for erosion protection was awarded March 31, 2006, and completed with a fiscal year cost of \$129,127. The project was operated and maintained at a cost of \$773,070 in FY07.

17. RECONNAISSANCE AND PROJECT CONDITION SURVEYS

Reconnaissance and condition surveys were conducted in FY 2007 at a total cost of \$55,674.

18. NAVIGATION WORK UNDER SPECIAL AUTHORIZATION

Navigation activities pursuant to Section 107, Public Law 86-645 (preauthorization):

No initial coordination for Section 107 navigation activities was performed in FY 07.

A Milestone Report was completed in June 2002 on Galveston Island Channel for the extension of a shallow draft channel on the west end of Galveston Channel. Project estimated cost is \$6.5 million which exceeds the Continuing Authorities Programs' limit by \$2.5 million. Project is on hold due to lack of federal funding. No cost was incurred in Fiscal year 07.

Mitigation of shore damages attributable to navigation projects pursuant to Section 111, Public Law 90-483: No mitigation of shore damage studies was performed in FY 2007.

Shore Protection

19. NATIONAL EROSION CONTROL DEVELOPMENT AND DEMONSTRATION PROGRAM, JEFFERSON COUNTY, TX

Location. The project location fronts the McFadden National Wildlife Refuge in the vicinity of Sea Rim State Park in Jefferson County, Texas. Beaches at the demonstration consist of a thin veneer of sand over mud and the average long-term annual erosion rate is approximately 5 feet.

Existing Project. The primary objectives of the project are to minimize erosion of the cohesive sediment and to minimize sand overwash. These objectives will be accomplished by constructing experimental low-volume beach nourishment templates contained by geotextile tube groin cells and dune construction. The 2,500 ft-long dune is designed to withstand a 5-year return period storm. Fronting half of the engineered dune corridor is a beach nourishment divided into four experimental cells of varying fill volumes and grain sizes. A geotextile tube groin separates each experimental cell.

Local Cooperation. A Memorandum of Agreement has been executed with the Texas General Land Office.

Operation During Fiscal Year. New Work: Construction was completed in August, 2004. Baseline project monitoring continued through FY07 at a cost of \$3,747.

Flood Control

20. BUFFALO BAYOU AND TRIBUTARIES, TX

Location. Improvements are on Buffalo Bayou watershed, a part of San Jacinto River watershed, in Harris County, west and northwest of city of Houston, Texas. (See Geological Survey quadrangle sheets for Harris County.)

Existing project. Provides for improvements of Buffalo Bayou and its tributaries above turning basin of Houston Ship Channel to control floods for protection of city of Houston, and prevent deposition of silt in turning basin of ship channel by construction of detention reservoirs, enlargement and rectification of channels and construction of control works.

Channel rectification on Brays Bayou with an improved channel length 25.4 miles was completed in March 1971. Channel rectification on White Oak Bayou was completed in 1976. Work remaining consists of rectification of approximately 22 miles of main stem of Buffalo Bayou.

See individual detailed reports on Addicks and Barker Reservoirs; and Brays, Greens, Halls, Hunting, Little White Oak, and Carpenters Bayous.

Local cooperation. Section 203, 1954 Flood Control Act applies. Local interests have accomplished all required local cooperation on Brays Bayou and White Oak Bayou. On Buffalo Bayou, local interests purchased interests that the United States had in 7 miles of rectified channel below Barker and Addicks Dams for \$256,651. Of the remaining required rights-of-way on Buffalo Bayou, local interests have acquired about 40 percent. About 53 percent of required bridge relocations and 3 percent of the required bridge relocations have been accomplished. Advance of \$4,400,000 by the Harris County Flood Control District was refunded in September 1956. Public Law 86-53 authorized reimbursement of \$38,726 to Galveston, Houston and Henderson Railroad Company for bridge alterations at Brays Bayou. Non-Federal contributions totaled \$63,661 for project betterment. Recreation development is subject to conditions of non-Federal cost sharing under Federal Water Project Recreation Act of 1965.

See individual detailed reports on Addicks and Barker Reservoirs; and Brays, Greens, Halls, Hunting, Little White Oak, and Carpenters Bayous.

20A. ADDICKS AND BARKER RESERVOIRS, TX

Location. Reservoirs are located in and west of the City of Houston in Harris and Fort Bend Counties, Texas.

Existing project. Construction of Barker Dam was complete in February 1945. Construction of Addicks Dam and 7.4 miles of channel rectification downstream from Addicks and Barker Dams was completed in October 1948. Modification of Barker and Addicks Dams consisting of gating the final two uncontrolled conduits in each dam, was complete in 1963. Major rehabilitation of Addicks and Barker Dams to prevent seepage through the embankment was completed in 1982.

Work under the Dam Safety Assurance program was initiated in Fiscal Year 1986. Work accomplished included raising approximately 32,400 feet of Addicks

Dam 1 to 3 feet and raising approximately 57,600 feet of Barker Dam 3 to 5 feet and armor-plating low ends of both dams. A contract with the city of Houston for cost sharing in the construction of recreation facilities was entered into in November 1981. The lease for approximately 10,534 acres of land and water areas was approved in February 1983.

Local cooperation. None required.

Operations during fiscal year. Recreation: Community Park West (Phase IB) and the velodrome were completed in 1986 and remain in use. Community Park West (Phase 4) and the development of Community Park 2 (soccer fields, ball fields, and parking lots) were completed by the City of Houston in 1992. Harris County Precinct 3 completed building additional soccer fields in Community Park 2 in George Bush Park. The Fort Bend County YMCA pavilion, archery range, Dog Park and nature trails in Barker Reservoir are being heavily used along with the City of Houston's Cullen Park, Harris County's George Bush Park, and Fort Bend County's Cinco Ranch Park. Maintenance and improvements of these recreation areas continue by all agencies. Fiscal year cost for operating and maintaining project was \$733,434.

Maintenance: New Work: The contract to replace guard rail at Addicks & Barker had a FY07 cost of \$8,750.

The project is estimated to have prevented damages of \$801,000 in FY07 for a cumulative total of 3,799,904,000.

20B. BRAYS BAYOU

Location. The project is located in the south-central portion of Buffalo Bayou, Harris County, TX.

Existing project. The authorized plan of improvement consists of 3 miles of stream improvements, 3 flood detention basins, and 7 miles of stream diversion channels. Aesthetic vegetation is included. Recreation facilities include trails, picnic facilities, sports fields, comfort stations and parking areas. The estimated cost for new work is \$320,947,000 Federal (Corps) and \$176,410,000 non-Federal consisting of \$27,479,000 cash contributions, and \$148,931,000 for lands and relocations (October 1, 2007 base price).

The project was authorized for construction in the Water Resources Development Act of 1990 (PL 101-640). In 1995, the project was divided into two separable elements, an Upstream (detention) Element (stream improvements and detention basins) and a Downstream (diversion) Element. The Local Sponsor was authorized to develop the project and design and

construct an alternative to the diversion component and be reimbursed for the Federal share by the Water Resources Development Act of 1996 (PL 104-303). Construction funds were received in 1998.

Location cooperation. Non-Federal Sponsor for the project is Harris County Flood Control District. Non-Federal Sponsor is required to provide lands, easements, and rights-of-way; modify or relocate buildings, pipelines, utilities, roads and other facilities, except for railroad bridges; pay five percent of the total costs allocated to flood control presently estimated at \$27,479,000 and bear all costs of operation, maintenance, and replacement of flood control and recreation facilities. A Project Cooperation Agreement for the Upstream (detention) element was executed March 3, 2000.

Operations during fiscal year. New Work: Construction of the Detention Element by the Non-Federal Sponsor continued in old Westheimer, Eldridge, and Art story Detention Basins. Final reimbursement was made for discrete segments 12, and 15 of Art Story Park and Eldridge Basins for a total cost of \$10,069,753. Discrete segments 21 and 22 of Art Story Park and Old Westheimer were accrued for a total of \$5,309,000. In accordance with Section 211 of the Water Resources Development Act of 1996, the sponsor is investigating the Downstream (diversion) Element in an effort to find an alternative to the authorized project.

20C. GREENS BAYOU

Location. Greens Bayou is a tributary of Buffalo Bayou, and is located in the north-central portion of Harris County, TX, and does not include the Halls Bayou tributary.

Existing project. The project was authorized for construction in the Water Resources Development Act of 1990 (PL 101-640). The authorized project provides for 25 miles of stream enlargement, 14 miles of stream cleaning and 4 flood detention basins. Aesthetic vegetation and mitigation is included. Recreation facilities include trails, picnic facilities, sports fields, launches, ramps, comfort stations and parking areas. The project is currently being reformulated and a new project has been identified in a General Reevaluation Study. The new project will consist of approximately 3.7 miles of stream enlargement in the upper reaches of the bayou between Veterans Memorial Drive and Cutten Road. A flood detention basin will be located near the downstream terminus of the stream enlargement. Aesthetic vegetation is included. Recreation facilities are not currently included in the project as a local sponsor has not been confirmed. The estimated cost for new work is \$30,951,000 Federal (Corps) and \$9,575,000 non-Federal consisting of \$2,027,000 cash

contributions, and \$7,548,000 for lands and relocations (October 1, 2007 base price).

Local cooperation. Non-Federal Sponsor for the project is Harris County Flood Control District. Non-Federal Sponsor is required to provide lands, easements, and rights-of-way; modify or relocate buildings, pipelines, utilities, roads and other facilities, except for railroad bridges; provide a cash contribution presently estimated at \$2,027,000 and bear all costs of operation, maintenance, and replacement of flood control and recreation facilities.

Operations during fiscal year. New Work: See Section 35, PRE-CONSTRUCTION ENGINEERING AND DESIGN.

20D. HALLS BAYOU

Location. Halls Bayou is a major tributary of Greens Bayou, located in the north-central portion of Buffalo Bayou, Harris County, TX.

Existing project. The authorized plan of improvement consists of 18 miles of stream improvements. Recreation facilities include trails, picnic facilities, boat ramps, a comfort station and parking areas. The estimated cost for new work is \$84,325,000 Federal (Corps) and \$59,965,000 non-Federal consisting of \$9,288,000 cash contributions, \$45,071,000 for lands and relocations, \$3,448,000 for Planning, Engineering, and Design (PED), and \$2,158,000 for Construction Management. (October 2006 base price).

The project was authorized for construction in the Water Resources Development Act of 1990 (PL 101-640).

Local cooperation. Non-Federal Sponsor for the project is Harris County Flood Control District. Non-Federal Sponsor is required to provide lands, easements, and rights-of-way; modify or relocate buildings, pipelines, utilities, roads and other facilities, except for railroad bridges; provide a cash contribution presently estimated at \$9,288,000 and bear all costs of operation, maintenance, and replacement of flood control and recreation facilities.

Operations during fiscal year. New Work: See Section 35, PRE-CONSTRUCTION ENGINEERING AND DESIGN.

20E. HUNTING BAYOU

Location. Hunting Bayou is located in Houston, approximately 4 to 5 miles from the central business district.

Existing project. The authorized plan of improvement consists of 14.3 miles of stream improvements. Recreation facilities include trails, picnic facilities, a comfort station and parking areas. The estimated cost for new work is \$82,966,000 Federal

(Corps) and \$71,439,000 non-Federal consisting of \$8,288,000 cash contributions, \$55,972,000 for lands and relocations, \$4,416,000 of Planning, Engineering and Design, and \$2,763,000 for Construction Management (October 1, 2006 base price).

The project was authorized for construction in the Water Resources Development Act of 1990 (PL 101-640). The Non-Federal Sponsor was authorized to design and construct an alternative to the project and be reimbursed for the Federal share by the Water Resources Development Act of 1996 (PL 104-303).

Local cooperation. Non-Federal Sponsor for the project is Harris County Flood Control District. Non-Federal Sponsor is required to provide lands, easements, and rights-of-way; modify or relocate buildings, pipelines, utilities, roads and other facilities, except for railroad bridges; provide a cash contribution presently estimated at \$8,288,000 and bear all costs of operation, maintenance, and replacement of flood control and recreation facilities.

Operations during fiscal year. New Work: Construction funds were received in 2003 to begin construction of the project. See Section 35, PRE-CONSTRUCTION ENGINEERING AND DESIGN.

20F. LITTLE WHITE OAK BAYOU, TX

Location. Little White Oak Bayou is a tributary of White Oak Bayou in north-central Houston.

Existing project. The authorized plan of improvement consists of 6.0 miles of stream enlargements. Recreation facilities include trails and picnic facilities. The estimated cost for new work is \$17,958,000 Federal (Corps) and \$17,957,000 non-Federal consisting of \$1,996,000 cash contributions, and \$15,961,000 for lands and relocations (October 1990 base price).

The project was authorized for construction in the Water Resources Development Act of 1990 (PL 101-640).

Local cooperation. Non-Federal Sponsor for the project is Harris County Flood Control District. Non-Federal Sponsor is required to provide lands, easements, and rights-of-way; modify or relocate buildings, pipelines, utilities, roads and other facilities, except for railroad bridges; provide a cash contribution presently estimated at \$1,996,000 and bear all costs of operation, maintenance, and replacement of flood control and recreation facilities.

Operations during fiscal year. New Work: Project is awaiting PRE-CONSTRUCTION ENGINEERING AND DESIGN funds.

20G. CARPENTERS BAYOU, TX

Location. Carpenters Bayou is a tributary of Buffalo Bayou in northeastern Houston.

Existing project. The authorized plan of improvement consists of 9.7 miles of stream enlargements. Recreation facilities include trails and picnic facilities. The estimated cost for new work is \$3,900,000 Federal (Corps) and \$1,950,000 non-Federal consisting of \$370,000 cash contributions, and \$2,320,000 for lands and relocations (October 1990 base price).

The project was authorized for construction in the Water Resources Development Act of 1990 (PL 101-640).

Local cooperation. Non-Federal Sponsor for the project is Harris County Flood Control District. Non-Federal Sponsor is required to provide lands, easements, and rights-of-way; modify or relocate buildings, pipelines, utilities, roads and other facilities, except for railroad bridges; provide a cash contribution presently estimated at \$370,000 and bear all costs of operation, maintenance, and replacement of flood control and recreation facilities.

Operations during fiscal year. New Work: Project is awaiting PRE-CONSTRUCTION ENGINEERING AND DESIGN funds.

21. CLEAR CREEK, TX

Location. The project is located about midway between the two metropolitan centers of Houston, Texas, on the north and Galveston-Texas City on the south in Harris and Galveston Counties above and below existing Clear Lake.

Existing project. The authorized plan of improvement consists of an improved channel from Mile 3.8 to Mile 34.8 to contain within its banks all flood flows up to and including that of a 100-year flood. The selected plan provides channel enlargement and easing of bends within the existing stream from Mile 3.8 to Mile 26.05 to contain at least the 10-year frequency storm, and additional outlet with gated structure from Clear Lake to Galveston Bay, restriction of development in the residual 100-year flood plain and measures to mitigate environmental effects. In 1986, at the request of Brazoria County Drainage District No. 4, that portion of the project upstream of the Brazoria/Galveston County line, approximate improved Mile 19.1, was placed in the "inactive" category. Estimated cost for new work, excluding "inactive" portion, is \$95,144,000 Federal (Corps) and \$59,157,000 non-Federal consisting of \$7,715,000 cash contributions, \$22,600,000 for lands, and \$28,842,000 for relocations (October 1, 2006 base price).

Environmental interest groups and agencies, private citizens, and some local communities located near or adjacent to Clear Lake expressed opposition to the Clear Creek Flood Control Project as currently authorized and planned for upstream reaches. In general, the opposition to the project has been focused on environmental concerns in the upstream reaches and on induced flooding concerns downstream in Clear Lake. Construction has been delayed at the request of the Non-Federal Sponsor so that an alternative to the authorized project can be developed that will reduce above concerns and still provide flood protection to those that are critically affected by flood waters in the watershed.

Local cooperation. Non-Federal Sponsors for the project are Galveston and Harris counties. The Local Cooperation Agreement, executed June 30, 1986, requires local interests to provide lands, easements, rights-of-way, and material disposal areas; modify or relocate building, pipelines, utilities, roads and other facilities, except railroad bridges, where necessary in the construction of the project; make a cash contribution for mitigation measures consistent with the non-Federal share of total project costs without mitigation measures; pay five percent of the total costs allocated to flood control; and bear all costs of operation and maintenance of flood control facilities. By letter of June 9, 1999, Brazoria County Drainage District No. 4 indicated its intent to be a project sponsor again beginning with participation in the General Reevaluation Report.

Operations during fiscal year. Preparation of the General Reevaluation Report continued. Work on plan formulation, engineering analysis, socioeconomic analysis, real estate analysis, and environmental studies continued.

22. LOWER RIO GRANDE BASIN, TX

Location. The project is located in Willacy, Hidalgo, and Cameron Counties. The basin is bounded on the east by the Gulf of Mexico, on the south by the Rio Grande, which forms the international boundary between the United States and Mexico, on the west by Starr County, and on the north by Brooks and Kenedy Counties.

Existing project. See individual detailed reports on Arroyo Colorado, South Main Channel, and Raymondville Drain.

Local cooperation. See individual detailed reports on Arroyo Colorado, South Main Channel, and Raymondville Drain.

22A. ARROYO COLORADO, TX

Location. The project is located in Hidalgo and Cameron Counties, Texas.

Existing project. The authorized project will provide flood protection along Highway 83 and erosion protection for the banks of the Arroyo Colorado in the city of Harlingen. The project consists of a gated water control structure, 1.4 miles of channel improvements, and stone armoring of selected reaches in Harlingen. The estimated cost for new work is \$5,851,000 Federal (Corps) and \$1,951,000 non-Federal consisting of \$1,848,000 cash and \$103,000 for lands and relocations (October 1, 1993 base prices).

The project has reached a stalemate as the Local Sponsor, the Hidalgo County Drainage District #1, cannot provide required guarantee to hold and save the Government free from all damages arising from the construction, operation, maintenance, repair and replacement for the project, nor are they able to operate and maintain the project when completed. The International Boundary and Water Commission has complete jurisdiction over the project, as it is one of the elements of the Rio Grande Floodway System. The Commission is interested in the project but only if additional funds to do operations and maintenance are provided. Legislative approval will be required to alter the current status.

Local cooperation. Non-Federal Sponsor, the Hidalgo County Drainage District #1, is required to provide lands, easements, and rights-of-way; modify or relocate buildings, pipelines, utilities, roads and other facilities, except for railroad bridges; provide a cash contribution presently estimated at \$1,848,000 and bear all costs of operation, maintenance, and replacement of flood control facilities.

Operations during fiscal year. None.

22B. SOUTH MAIN CHANNEL, TX

Location. The project is located in Hidalgo and Willacy Counties, Texas.

Existing project. The authorized project consists of channel improvements that will provide flood protection to the city of Lyford, as well as the rural area of Willacy County north of U.S. Highway 83. The authorized plan is currently being revised to reflect a smaller project and will include construction of new channels only in Willacy County, and a local protection project for Lyford. The estimated cost for new work is \$156,538,000 Federal (Corps) and \$79,389,000 non-Federal consisting of \$11,796,000 cash, \$28,107,000 lands, and \$39,486,000 relocations (October 1, 2006 base prices).

Local cooperation. Originally the Non-Federal Sponsors for the project were Hidalgo County Drainage District #1 and Willacy County Drainage District #1. Late in Fiscal Year 1999, Hidalgo County Drainage District #1 withdrew support of the project. In August

1999, Willacy County Drainage District #1 restated their intent to cost-share in project construction.

Non-Federal Sponsor is required to provide lands, easements, and rights-of-way; modify or relocate buildings, pipelines, utilities, roads and other facilities, except for railroad bridges; provide a cash contribution presently estimated at \$11,796,000 and bear all costs of operation, maintenance, and replacement of flood control facilities.

Operations during fiscal year. New Work: See Section 35, PRE-CONSTRUCTION ENGINEERING AND DESIGN.

22C. RAYMONDVILLE DRAIN, TX

Location. The project is located in northern Hidalgo and Willacy Counties, Texas.

Existing project. The authorized project will provide a drainage outlet to the Laguna Madre for northern Hidalgo and Willacy Counties. The project consists of 43.8 miles of channel work, including enlargement of existing channels and construction of new channels, a 3.88-mile long levee, and diversion ditches along the west side of Raymondville. The estimated cost for new work is \$75,107,000 Federal (Corps) and \$25,036,000 non-Federal consisting of \$9,890,000 cash, \$6,142,000 lands, and \$9,004,000 relocations (October 1, 2006 base prices).

Local cooperation. Non-Federal Sponsor for the project is Hidalgo County Drainage District #1. Non-Federal Sponsor is required to provide lands, easements, and rights-of-way; modify or relocate buildings, pipelines, utilities, roads and other facilities, except for railroad bridges; provide a cash contribution presently estimated at \$8,390,000 and bear all costs of operation, maintenance, and replacement of flood control facilities.

Operations during fiscal year. New Work: See Section 35, PRE-CONSTRUCTION ENGINEERING AND DESIGN.

23. SIMS BAYOU, TX

Location. The project is located in Harris County, in the southern portion of Houston, Texas.

Existing project. The authorized plan of improvement provides for enlargement and rectification, with appropriate erosion control measures, of 19.3 miles of Sims Bayou to provide 25-year flood protection; environmental measures and riparian habitat improvement along the entire alignment; and recreational development to include 14 miles of hike-and-bike trails connecting to existing public parks, together with picnic, playground, and other leisure facilities. Estimated cost for new work is \$250,937,000 Federal (Corps) and \$123,937,000 non-Federal consisting of \$21,914,000 cash contributions,

\$44,620,000 for lands, \$56,483,000 for relocations, and \$329,000 for channels (October 1, 2007 base price).

Local cooperation. Non-Federal Sponsor for the project is Harris County Flood Control District. In accordance with the cost-sharing and financing concepts reflected in the Water Resources Development Act of 1986, local interests are required to provide lands, easements, and rights-of-way; modify or relocate buildings, pipelines, utilities, roads, and other facilities, except railroad bridges, where necessary for the construction of the project; pay one-half of the separable and joint costs allocated to recreation; and bear all costs of operation, maintenance and replacement of recreation facilities; and pay 5 percent of the costs allocated to flood control; and bear all costs of operation, maintenance and replacement of flood control facilities. The Local Cooperation Agreement for flood control was executed on October 19, 1990. The recreation Local Project Agreement is currently under review by the City of Houston.

Operations during fiscal year. New Work: A construction contract for channel rectification downstream of Cullen to State Highway 288, awarded September 13, 2002, continued through FY07 at a cost of \$2,597,216.

Channel rectification contract for the Robin Boulevard to State Highway 288 reach awarded May 31, 2005, continued through FY07 at a cost of \$3,878,205. Work was delayed due to weather and the contract was modified to extend the required completion date by 65 days. A bridge failure at SH288 resulted in a revised design (for the south abutment) and approval by TXDOT. A sediment removal and channel repair contract was awarded June 30, 2006 for repairs downstream of Cullen Boulevard to the Mouth. Cost incurred for FY07 was \$4,770,558. The Swallow Sheetpile Wall Removal contract was awarded in May 2007 and incurred cost of \$1,343,935. The Limited Reevaluation Report for the recreation feature was prepared and submitted to Division.

24. INSPECTION OF COMPLETED FLOOD CONTROL WORKS

Inspections of completed projects operated and maintained by Non-Federal interests were made on the following projects. A supplemental Operation and Maintenance Manual was initiated on the Texas City and Vicinity Hurricane Flood Protection Project. Fiscal year cost for Inspection of Completed Flood Control Works was \$149,482.

<u>Project</u>	<u>Date of Inspection</u>
Texas City & Vicinity Hurricane Flood Protection, TX Phase II Assessment of 1 Walls	April 2007
Lynchburg Pump Station, TX Hurricane Flood Protection	June 2007
Colorado River, TX Flood Protection at Matagorda	January 2007

No costs were incurred in FY07 for snagging and clearing activities for flood control pursuant to Section 208 of the Flood Control Act of 1954, Public Law 780, as amended.

Environmental Restoration

27. PROJECT MODIFICATIONS FOR IMPROVEMENT OF ENVIRONMENT

Project modifications for improvement of environmental activities pursuant to Section 1135 of the Water Resources Development Act of 1986, Public Law 99-662, as amended: Fiscal year 2007 cost was \$5,849.

A feasibility study was initiated in 2003 on Taylor’s Bayou for the replacement of a saltwater barrier to protect the bayou and marsh from saltwater intrusion, but was placed on hold awaiting Federal funding.

A preliminary Restoration Plan for Keith Lake Fish Pass in Jefferson County was completed in May 2002. A feasibility study was initiated in January 2003 but was placed on hold awaiting Federal funding.

25. FLOOD CONTROL WORK UNDER SPECIAL AUTHORIZATION

Flood control activities pursuant to section 205 of 1970 Flood Control Act, Public Law 858, 80th Congress, as amended and Emergency flood control – repair, flood fighting, and rescue work (Public Law 99, 84th Congress and antecedent legislation):

Emergency Response Activities – Flood Control and Coastal Emergencies.

Disasters. The Galveston District activated its Emergency Operations Center (EOC) a total of three times in Fiscal Year 2007. The EOC was activated once for flood and hurricane related disasters, without any work for FEMA and twice for flood and hurricane disasters, with work for FEMA.

Operational Program Areas. Fiscal year 2007 costs: disaster preparedness \$401,843; emergency operations \$101,993; inspection of non-Federal flood control works \$2,717; national emergency preparedness \$28,500; and anti-terrorism/force protection \$191,708.

Emergency Work in Support of Other Federal Agencies. Fiscal Year 2007 costs supporting FEMA under the Stafford Act: Hurricane Rita (Texas) \$1,983,592; Hurricane Emily (Texas) \$29,349; and Hurricane Dean (Texas) \$158,350.

26. EMERGENCY STREAM BANK AND SHORELINE EROSION WORK AND SNAGGING AND CLEARING ACTIVITIES UNDER SPECIAL AUTHORIZATION

Stream bank and shoreline erosion activities pursuant to Section 14 of the 1946 Flood Control Act, Public Law 525, as amended:

Initial coordination for Section 14 Emergency Stream Bank and Shoreline Erosion activities was performed in FY07 at for a cost of \$29,860.

28. AQUATIC ECOSYSTEM RESTORATION

Coordination of Aquatic Ecosystem Restoration to improve the quality of the environment pursuant to section 206 of the Water Resources Development Act of 1996, Public Law 104-303, as amended:

Fiscal year costs for coordination were \$6,351.

Construction for the University of Texas Wetlands Education Center for the restoration of wetlands and dunes in support of the Education Center began in 2004. See Section 30-UNIVERSITY OF TEXAS MARINE SCIENCE INSTITUTE (UTMSI), TX.

The feasibility study for the Gulf Intracoastal Waterway, Mad Island Marsh to protect the habitat at the Wildlife Management Area from further erosion continued through FY 07 at a cost of \$13,702.

A Preliminary Restoration Plan to prevent further erosion of ecosystem at the Galveston Bay Prairie Preserve at Moses Lake was completed in FY04. The project has been placed on hold awaiting Federal funds.

A Preliminary Restoration Plan for Aquatic ecosystem restoration of Galveston County MUD (Municipal Utility District) 12 was approved July 2004. Alternative formulation began in FY04 but has been placed on hold awaiting Federal funds.

29. NORTH PADRE ISLAND, TX

Location. The project is located along the south central Texas coast on the northern portion of Padre Island, City of Corpus Christi, Nueces County, Texas. The project cuts through Mustang Island joining the Gulf of Mexico with the Gulf Intracoastal Waterway at mile 553.0

Existing project. The project was authorized by the Water Resources Development Act of 1999. The authorized plan of improvement provides for an opening between the Gulf of Mexico and Corpus Christi Bay, which consists of a jettied entrance and channel, extending from the Gulf of Mexico through Mustang Island along the existing Packery Channel; storm damage reduction measures on the south side of the area; and ecosystem restoration measures at various locations adjacent to the project area. Tidal surges caused by Hurricane Emily in June 2005 and Hurricane Rita in September 2005 caused damages to both the south and north jetties and to areas of the concrete cellular mats. Cost to repair these damages have increased the Federal cost by an additional \$2.5 million and the non-Federal share by an additional \$1.346 million. The estimated cost for new work is \$22,121,000 Federal (Corps) and \$12,928,000 non-Federal consisting of \$11,401,000 cash contributions, \$510,000 for lands, easements, rights-of-way, relocations, and 1,017,000 for betterments. (October 1, 2005 base price).

Local cooperation. Non-Federal Sponsor for the project is City of Corpus Christi, Texas. In accordance with the cost-sharing and financing concepts reflected in the Water Resources Development Act of 1986, Non-Federal interests are required to provide lands, easements, and rights-of-way; modify or relocate buildings, pipelines, utilities, roads, and other facilities, except for railroad bridges; provide a cash contribution presently estimated at \$11,401,000 and bear all costs of operation and maintenance.

Operations during fiscal year. New Work: The construction contract awarded July 30, 2003 continued through FY07 at a cost of \$580,543.

30. UNIVERSITY OF TEXAS MARINE SCIENCE INSTITUTE (UTMSI) SECTION 206, TX

Location. The project is located on the UTMSI Campus in Port Aransas, Nueces County, Texas. Port Aransas is located on the northern most portion of Mustang Island. Mustang Island is a barrier island that separates Corpus Christi Bay from the Gulf of Mexico. The proposed wetland restoration will be performed immediately adjacent to the Corpus Christi Ship Channel.

Existing project. The project consists of wetland restoration features which will be constructed on 2.6 acres located on the UTMSI campus. In addition, approximately 1600 feet of dunes were created. A broad range of estuarine habitat types were constructed by removing several feet of the existing surface materials to achieve the target elevation contours necessary to support target communities. The creation of a number of diverse habitats, including open water, submerged aquatic vegetated shallows, low and high marsh, sand flats and upland islands and dunes, allows for use of the area by several fish and wildlife species, including fishes, invertebrates, reptiles, small mammals and birds. Open water and marsh surface habitats were constructed to resemble natural marsh systems in the area with undulating surfaces, high and lows, and main channel with tributaries. The marsh system was connected to the surrounding tidal waters to provide daily tidal exchange by installing two 36-inch culverts that were completely submerged. The total project cost was \$2,100,000. Construction was completed in 2007.

Local cooperation. The project sponsor is The University of Texas Board of Regents, and the U.T. Marine Science Institute. A project cooperation agreement was executed March 2004.

Operations during fiscal year. New Work: A construction contract was awarded January 30, 2006 to create a wetland habitat. It continued through Fiscal Year 2007 at a cost of \$868,826.

31. BENEFICIAL USES OF DREDGED MATERIAL

Projects for beneficial uses of dredged material pursuant to Section 204 of the Water Resources Development Act of 1992, Public Law 102-560 incurred costs of \$13,612 in FY07.

General Investigations

32. SURVEYS

Fiscal year costs for reconnaissance and feasibility studies were \$1,911,659 for navigation and \$77,548 for flood damage prevention. Reconnaissance and feasibility studies on watershed and ecosystem projects incurred costs of \$452,434. No cost was incurred for a reconnaissance study for shoreline protection in FY 07. Reconnaissance and feasibility studies on review of authorized projects incurred costs of \$118,279 for FY 07. Miscellaneous Activities for FY 07 include the following: Special Investigations at a cost of \$25,010; Interagency Water Resources Development at \$30,008; National Estuary Program at \$3,479; and North

American Waterfowl Management Plan at a cost of \$1,670.

33. COORDINATION WITH OTHER AGENCIES

Cost for Coordination With Other Agencies was \$29,766 for FY 2007.

34. COLLECTION AND STUDY OF BASIC DATA

Floodplain management, technical services and quick responses to collection and study of basic data were performed at a cost of \$24,937, \$24,966 and \$49,903; respectively. No cost was incurred in FY07 for hydrologic studies.

35. PRE-CONSTRUCTION ENGINEERING AND DESIGN

Greens Bayou, Texas – The project was authorized for construction in the Water Resources Development Act of 1990 (PL 101-640). The authorized project provides for 25 miles of stream enlargement, 14 miles of stream clearing and 4 flood detention basins. Aesthetic vegetation and mitigation is included. Recreation facilities include trails, picnic facilities, sports fields, launches, ramps, comfort stations and parking areas. The project is currently being reformulated and a new project has been identified in a General Reevaluation Study. The new project will consist of approximately 3.2 miles of stream enlargement in the upper reaches of the bayou between Veterans Memorial Drive and Cutten Road. A flood detention basin will be located near the downstream terminus of the stream enlargement. Aesthetic vegetation is included. Recreation facilities are not currently included in the project as a local sponsor has not been confirmed. Estimated planning and engineering cost is \$9,420,000. Planning and engineering studies were initiated in FY 1990. Fiscal year costs were \$114,171.

South Main Channel, Texas – The authorized project consists of channel improvements, which will provide flood protection to the cities of McAllen, Edinburg, Edcouch, La Villa and Lyford, as well as the rural areas of Hidalgo and Willacy Counties north of U.S. Highway 83. The authorized plan is currently being revised to reflect a smaller project and will include construction of new channels only in Willacy County, and a local protection project for Lyford, Texas. Estimated planning and engineering cost estimate is \$8,780,000. Planning and Engineering

studies were initiated in FY 1990. No cost cost was incurred in FY07.

Raymondville Drain, Texas - The project consists of 43.8 miles of channel work, including enlargement of existing channels, and construction of new channels, a 3.88-mile long levee, and diversion ditches along the west side of Raymondville, Texas. Estimated planning and engineering estimate is \$6,924,000. Planning and engineering studies were initiated in FY 1997. Fiscal year costs were \$398,426.

Hunting Bayou, Texas - The project was authorized for construction in the Water Resources Development Act of 1990 (PL 101-640). The authorized project provides for 14.3 miles of stream improvements, recreation trails, picnic facilities, a comfort station, access and parking areas. The Non-Federal Sponsor was authorized to design and construct an alternative to the project and be reimbursed for the Federal share by the Water Resources Development Act of 1996 (PL 104-303). The project is currently being reformulated and will be identified by the General Reevaluation Study.

Estimated planning and engineering estimate is \$2,070,000. Planning and engineering studies were initiated in FY 1998. No cost was incurred in Fiscal Year 2007.

Colonias Along U.S. and Mexico Border, Texas - The project was authorized in accordance with the Water Resources Development Act of 1992, Section 219 (PL 102-580). Assistance is to be provided to non-Federal interests for carrying out water related environmental infrastructure and resource protection and development projects for selected areas along the Texas/Mexico borders. Estimated planning and engineering cost estimate is \$1,720,000. Planning and engineering studies were initiated in FY 2001. Preliminary design began in FY 04 on Villa Nueva Colonia, Rose Acres Colonia, and LaPresa Colonia. All three design projects will be cost shared 75% Corps and 25% Sponsor. The cost sharing Sponsors are as follows: Villa Nueva-City of Brownsville; Rose Acres – Nueces County; and LaPresa – Webb County. Fiscal year costs were \$52,050.

GIWW, Matagorda Bay, Texas - The project consist of realigning the navigation channel from mile 460 to mile 472 with a channel approximately 6,000 feet north of and paralleling the existing route. Channel dimensions are 12 feet deep by 125 feet wide for most of the channel, with a widening to 300 feet where it crosses the Matagorda Ship Channel, and flares at each of the places where the channel changes direction. Material dredged from the channel will be used to create marshes in Matagorda Bay and to combat erosion along Matagorda Peninsula. The existing channel from mile 460 to 473 would be abandoned. Estimated planning and engineering cost estimate is \$1,292,000. Planning

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

and engineering studies were initiated in FY 2002. No cost was incurred in FY 07.

Texas City Channel, Texas - The project was authorized in accordance with the Water Resources Development Act of 1986. Planning, engineering and design has been on hold since 1990 at the request of the Non-Federal Sponsor, the City of Texas City. Planning, engineering and design was resumed in FY 02. A reconnaissance level study was performed and it was determined that the authorized project is in the Federal interest and meets current needs. Estimated planning and engineering cost estimate is \$5,898,000. Planning and engineering studies were initiated in FY 2002. Fiscal year costs were \$635,043.

Corpus Christi Ship Channel, Texas - The Corpus Christi Ship Channel (45-foot) project, 40 miles long, is a Federally constructed deep-draft navigation project serving the ports at Harbor Island, Ingleside, and Corpus Christi in Nueces County. The recommended plan of improvement will deepen the channel to 52 feet, widen to 530 feet, add barge lanes on both sides of the channel across Corpus Christi Bay, and extend the La Quinta channel one and one-half miles at a depth of 39 feet.

Estimated planning and engineering cost estimate is \$1,978,000. Planning and engineering studies were initiated in FY 2003. Fiscal year costs were \$120,746.

GIWW, High Island to Brazos River, Texas - The project covers the reach of the Gulf Intracoastal Waterway from Rollover Pass at Mile 330 to West Bay at Mile 373, approximately 43 miles of channel in Galveston and Brazoria Counties. The recommended project includes a sediment basin at Rollover Pass, widening the channel area to 75 feet for a length of 1400 feet at Sievers Cove, widening the channel at the

Texas City Wye, setting back existing mooring facilities by 80 feet at Pelican Island, protecting existing open channels from wave action at Greens Lake, and establishing a mooring basin at the West Bay washout.

Estimated planning and engineering cost estimate is \$781,000. Planning and engineering studies were initiated in FY 2004. Fiscal year costs were \$127,757.

Halls Bayou, Texas - The project was authorized for construction in the Water Resources Development Act of 1990 (PL 101-640). The authorized plan of improvement consists of 18 miles of stream improvements. Recreation facilities include trails, picnic facilities, boat ramps, a comfort station and parking areas.

Estimated planning and engineering cost estimate is \$7,904,000. Planning and engineering studies were initiated in 1992 but was put on hold at the end of the year at the request of the Sponsor, Harris County Flood Control District. In 2005 a minimal amount of funds were placed on the project to update the economics and cost estimate. In FY 06 \$3,205 was expended to complete the update of project's economics and cost estimate. No cost was incurred in FY07.

Cedar Bayou, Texas - The project was re-authorized for construction in the Water Resources Development Act of 2000 (PL 106-541) under Section 349(a) (2) in December 2000. The recommended plan of improvement consists of extending the channel 8 miles at the dimensions of 10 x 100 from Mile 3.0 to Mile 11.0, or just below State Highway 146. Estimated planning and engineering cost estimate is \$ 1,042,000. Planning and engineering studies were initiated in FY 2002. Fiscal year costs were \$143,875.

TABLE 40-A COST AND FINANCIAL STATEMENT

See Section in Text	Project	Funding	FY 04	FY 05	FY 06	FY 07	Total Cost To Sep. 30, 2007 ³⁰
---------------------	---------	---------	-------	-------	-------	-------	---

¹ Excludes \$1,637,270 credit for contributed work.

² Includes \$675,855 for previous projects. In addition, \$10,571,509 expended from contributed funds, of which \$123,361 was for previous projects. Excludes \$874,258 expended from contributed funds for dock removal for the local sponsor.

³ In addition, \$1,681,103 expended from contributed funds and \$34,000 expended from contributed funds for Port Isabel; \$1,208,789 expended from contributed funds from the City of South Padre Island for beneficial placement of dredged material on the South Padre Island Beach; \$1,097,790 expended from contributed funds from Texas General Land Office; \$383,958 expended from contributed funds from the Brownsville Navigation District for rehabilitation of levees at Placement Area #4.

⁴ Includes \$39,087 for previous projects. In addition \$25,000 expended from contributed funds.

⁵ Includes \$69,784 for previous projects.

⁶ Includes \$48,711 for previous projects.

⁷ Includes \$46,101 for previous projects.

⁸ Includes \$1,372,534 for previous projects. Includes \$456,515 for Sec. 107 project for Port Aransas Breakwaters. In addition \$768 expended from contributed funds for Port Aransas Breakwaters.

⁹ Includes \$62,452 for previous projects. In addition, \$1,827,731 expended from contributed funds.

¹⁰ Includes \$147,098 for previous projects. In addition, \$21,014,645 expended from contributed funds. (\$581,615 on 45-foot project.)

¹¹ In addition, \$229,311 expended from contributed funds.

¹² Includes \$8,421,996 for previous projects. In addition, \$3,648,932 expended from contributed funds.

¹³ Includes \$86,126 for previous projects. In addition, \$3,276,588 expended from contributed funds.

¹⁴ Includes \$706,709 for previous projects. Includes Sec. 107 projects for Port Isabel Small Boat Basin (\$46,559); Port Isabel Side Channel (\$8,414); Offatts Bayou (\$356,466); and Channel to Aransas Pass (\$658,573). In addition contributed funds expended for Port Isabel Small Boat Basin (\$46,559); Offatts Bayou (\$49,665); Channel to Aransas Pass

(\$347,950); Chocolate Bayou (\$658,310); Mouth of Colorado River (\$3,397,080); (\$2,873,897) Channel to Victoria; (\$862,716) expended for the local sponsor's levee requirement on Channel to Victoria; and \$1,489,921 expended for expanding the turning basin

¹⁵ Includes \$1,526,564 for previous projects. In addition \$22,672 contributed funds for main channel, \$1,180,779 contributed funds for Rollover Pass (beginning 1997), and \$168,414 contributed funds for marsh restoration in an area between Bastrop Bayou and Galveston. Includes following amounts for tributary channels separately funded starting in fiscal year 1987: Channel to Victoria \$32,260,191. Channel to Aransas Pass \$2,600. Chocolate Bayou Channel \$10,227,823. In addition \$1,515,574 was contributed for Chocolate Bayou Channel. Includes following amounts for tributary channels separately funded starting in fiscal year 1989: Channel to Harlingen \$10,762,504. Channel to Port Mansfield \$12,865,798. Also includes \$23,456,533 for Mouth of Colorado River, separately funded beginning in fiscal year 1992 and \$28,140 contributed funds for Channel to Harlingen beginning in fiscal year 1998.

¹⁶ Includes \$1,526,564 for previous projects. In addition \$22,672 expended from contributed funds for main channel, \$1,006,648 contributed funds for Rollover Pass (beginning 1997) for the beneficial placement of dredge material at Rollover Pass., and \$168,325 contributed funds for marsh restoration in an area between Bastrop Bayou and Galveston. Includes following amounts for tributary channels separately funded starting in fiscal year 1987: Channel to Victoria \$26,822,867, Channel to Aransas Pass \$2,600, Chocolate Bayou Channel \$8,833,450. In addition \$1,515,574 was expended from contributed funds for Chocolate Bayou Channel. Also includes amounts for tributary channels separately funded starting in fiscal year 1989: Channel to Harlingen \$10,762,504. Channel to Port Mansfield \$11,327,407. Also includes an expended amount of \$23,838,656 for Mouth of Colorado River, separately funded in fiscal year 1992. In addition, includes \$28,140 contributed funds expended beginning in fiscal year 1998 for Channel to Harlingen.

¹⁷ Includes \$4,105,157 for previous projects. In addition, \$2,591,939 expended from contributed funds, of which \$1,209,179 was for previous projects.

TABLE 40-B AUTHORIZING LEGISLATION

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
---------------------	----------------------	-----------------------------	-----------

TABLE 40-B AUTHORIZING LEGISLATION

1. AQUATIC PLANT CONTROL, TX			
	Oct. 27, 1965	Provides for control of progressive eradication of aquatic plant growth from the navigable waters and streams in the U.S.	H. Doc. 251, 89 th Cong., 1st Sess.
	Nov. 17, 1986	Amended cost sharing requirements to provide for 50 percent Federal and 50 percent non-Federal participation in control operations.	Sec. 103(c), PL 99-662
2. BRAZOS ISLAND HARBOR, TX			
	Jun. 3, 1930	Jetties and jetty channel, inside channels and basins.	Rivers and Harbors Committee Doc. 16, 71st Cong., 2nd Sess.
	May 24, 1934 (PWA) Aug. 30, 1935	Local cooperation requirement modified to provide contribution of funds to cover cost of original dredging of all inside channels and basins.	Rivers and Harbors Committee Doc. 10, 71st Cong., 1st Sess.
	Aug. 26, 1937	Deepen jetty channel to 31 feet and inner channels and Brownsville and Port Isabel turning basins to 28 feet.	Rivers and Harbors Committee Doc. 32, 75th Cong., 1st Sess.
	Mar. 2, 1945	Enlarge Port Isabel turning basin.	H. Doc. 335, 76th Cong., 1st Sess.
	Mar. 2, 1945	Deepen entrance channel to 35 feet; deepen to 33 feet channel across Laguna Madre; deepen to 32 feet channels from Laguna Madre to turning basins at Brownsville and Port Isabel; widen turning basins; and dredging present shallow-draft channel south of Port Isabel from railroad bridge to Laguna Madre and connecting channel to Port Isabel turning basin.	H. Doc. 347, 77th Cong., 1st Sess.
	Jul. 24, 1946	Additional connecting channel between Port Isabel and Brownsville channels; and transfer shallow-draft channels at Port Isabel to GIWW.	H. Doc. 627, 79th Cong., 2nd Sess.
	May 17, 1950	Deepen to 38 feet in outer bar channels and 36 feet in all other authorized channels and basins; extend existing turning basins at Brownsville and Port Isabel; and construct small-boat basin with a connecting channel next to Brownsville ship channel.	H. Doc. 192, 81st Cong., 1st Sess.
	Jul. 14, 1960	Widen Brownsville Channel to 300 feet at a depth of 36 feet from former Goose Island passing basin to turning basin extension, thence at a width of 500 feet and same depth to turning basin proper, deepen to 36 feet in area in southeast corner of turning basin, maintain two existing basins of fishing harbor, and a connecting channel, and construct a third basin, with necessary connecting channel and extend Brazos Island Harbor north jetty seaward 1,000 feet. ²⁷	H. Doc. 428, 86th Cong., 2nd Sess. ¹

TABLE 40-B **AUTHORIZING LEGISLATION**

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
BRAZOS ISLAND HARBOR, TX (Continued)			
	Nov. 17, 1986	Enlargement of the entrance channel from deep water in the Gulf of Mexico to the Laguna Madre to a depth of 44 feet and a width of 400 feet; enlargement of the Turning Basin Extension to a point 800 feet beyond the grain elevator to a depth of 42 feet at widths varying from 325 to 400 feet; removal of Brownsville Navigation District Wharves 5, 6, and 9 to permit widening of the adjacent portion of the Turning Basin to 1,200 feet at a depth of 36 feet; construction of asphalt walkways with handrails on the crown of the North and South Jetties, and construction of park-type public use facilities at the inner end of the North Jetty.	Sec. 201, PL 99-662
3. CEDAR BAYOU, TX			
	Jul. 3, 1930	Channel 10 feet deep and 100 feet wide from Houston Ship Channel to a point on bayou 11 miles above mouth. ²⁹	S. Doc 107, 71st Cong., 2nd Sess. ¹
	Dec. 11, 2000	Channel 12 feet deep and 125 feet wide from Houston Ship channel to a point on bayou 11 miles above mouth.	S. 349 (a)(2), PL 106-541
		Modified Section 349(a)(2) of Water Resources Development Act of 2000 to direct the Secretary to credit, in accordance with Section 222 of Federal Control Act of 1970, toward the non-Federal share of the cost of the project the cost of planning and design work carried out by the non-Federal interest for the project before the date of the partnership agreement for the project.	
	Nov. 8, 2007	Specifies cost sharing for construction and operation and maintenance of the project shall be determined in accordance with Section 101 of the Water Resources Development act of 1986.	
		Amends Section 349(a)(2) of the water Resources Development Act of 2000 by striking “12 feet deep by 125 feet wide” and inserting “that is 10 feet deep by 100 feet wide”.	
4. CHANNEL TO PORT BOLIVAR, TX			
	Jun. 25, 1910	A channel 30 feet deep and 200 feet wide from deep water in Galveston Harbor extending to a turning basin 1,000 feet square and 30 feet deep. ³⁰	H. Doc. 328, 61st Cong., 2nd Sess.
	Mar. 4, 1919	Enlargement, extension and protection of turning basin. ³⁰	H. Doc. 1122, 65th Cong., 2nd Sess. ¹
5. CHOCOLATE BAYOU (DMMP), TX			
	JuL. 21, 1994	National Harbors Program: Dredged Material Management Plans (DMMP)	EC 1165-2-200
6. CORPUS CHRISTI SHIP CHANNEL, TX			
	Mar. 3, 1899	Acquisition of old curved portion of north jetty previously constructed by private parties.	Specified in Act.
	Jun. 13, 1902	Complete north jetty in accordance with builder’s plans.	Specified in Act.

TABLE 40-B AUTHORIZING LEGISLATION

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
CORPUS CHRISTI SHIP CHANNEL, TX (Continued)			
	Mar. 3, 1905	Complete north jetty in accordance with builder's plans.	Specified in Act.
	Mar. 2, 1907	Connect old curve to St. Joseph Island, and construct south jetty.	Rivers and Harbors Committee Doc. 5 59 th Cong., 2 nd Sess.
	Feb. 27, 1911	Dredge roadstead in Harbor Island Basin to 20 feet deep and construct 10,000 linear feet of stone dike on St. Joseph Island.	H. Doc. 1094, 61st Cong., 3rd Sess.
	Mar. 4, 1913 ²	Channel between jetties and Harbor Island Basin to 25 feet deep, extend jetties seaward, extend dike on St. Joseph Island 9,100 feet, and dredge approach channel 12 feet deep to town of Port Aransas.	H. Doc. 1125, 62nd Cong., 3rd Sess.
	Sep. 23, 1922	Dredging channel from Aransas Pass to Corpus Christi, 25 feet deep, 200 feet bottom width.	H. Doc. 321, 67th Cong., 2nd Sess.
	Jul. 3, 1930 ³	Deepen entrance channel from gulf to Harbor Island and provide an inner basin at Harbor Island of reduced area but greater depth.	H. Doc. 214, 70th Cong., 1st Sess.
	Jul. 3, 1930	Channel from Aransas Pass to Corpus Christi Channel with depth 30 feet.	Rivers and Harbors Committee Doc. 9, 71st Cong., 1st Sess.
	Aug. 30, 1935 ⁴	Enlarge all channels from gulf to western end of basin dredge by Humble Oil and Refining Co., at its docks on Harbor Island.	Committee Docs. 35, 72nd Cong., 1st Sess., and 40, 73rd Cong., 2nd Sess.
	Aug. 30, 1935	Maintain channel and maneuvering basin between breakwater and western shoreline of Corpus Christi Bay.	H. Doc. 130, 72nd Cong., 1st Sess.
	Aug. 30, 1935	Maintain 30-foot depth of approach channel, turning basin at Corpus Christi, Industrial Canal and turning basin at Avery Point.	Rivers and Harbors Committee Doc. 13, 74th Cong., 1st Sess.
	Aug 30, 1935	Maintain and deepen to 32 feet channel from deep water at Port Aransas to and including turning basin at Corpus Christi.	Rivers and Harbors Committee Doc. 63, 74th Cong., 1st Sess.
	Jun. 20, 1938	Extend main turning basin at Corpus Christi westward 2,500 feet at its present width and depth, deepen existing Industrial Canal and turning basin to 32 feet and extend this canal at a depth of 32 feet and general width of 150 feet, westward along Nueces Bay shore to a turning basin 32 feet by 900 feet, and 1,000 feet long near Tule Lake.	H. Doc. 574, 75th Cong., 3rd Sess.
	Mar. 2, 1945	Provide depth of 34 feet in all project channels and basins from Port Aransas to and including Tule Lake turning basin, for a width of 250 feet from Port Aransas to breakwater at Corpus Christi, for a width of 200 feet in Industrial Canal and in channel between Avery Point and Tule Lake turning basins, and widen Avery Point turning basin to 1,000 feet.	H. Doc. 544, 78th Cong., 2nd Sess.

TABLE 40-B **AUTHORIZING LEGISLATION**

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
CORPUS CHRISTI SHIP CHANNEL, TX (Continued)			
	Jun 30, 1948	Deepen entrance channel to 38 feet from gulf to outer end of jetty; 38 feet decreasing to 36 feet thence to station 90 north jetty; and 36 feet in all other deep water channels and basins except 2,000-foot undredged part of inner basin at Harbor Island, and a width of 400 feet in channel from Port Aransas to Maneuvering basin at Corpus Christi.	H. Doc. 560, 80th Cong., 2nd Sess.
	Sep. 3, 1954	An anchorage basin 12 feet deep, from 300 to 400 feet wide, and 900 feet long in Turtle Cove at Port Aransas, Texas.	H. Doc. 654, 81st Cong., 1st Sess.
	Sep. 3, 1954 ^s	Branch channel 32 feet by 150 feet, extending northerly from main channel in vicinity of Port Ingleside, along north shore of Corpus Christi Bay to Reynolds Metals Co. plant and turning basin 32 feet deep and 800 feet square near plant in general vicinity of LaQuinta, Texas.	H. Doc. 89, 83 rd Cong., 1st Sess.
	Sep. 3, 1954	An entrance channel 36 by 400 feet on a tangent alignment from 400-foot channel in Corpus Christi Bay, near Corpus Christi breakwater to flared approach channel to Corpus Christi turning basin.	H. Doc. 487, 83rd Cong., 2nd Sess.
	Jul. 3, 1958	Deepen and widen LaQuinta Channel to 36 by 200 feet; enlarge LaQuinta S. turning basin to 36 by 800 by 1,000 feet; a flared entrance to channel; and widening at curves.	S. Doc. 33, 85th Cong., 1st Sess.
	Jul. 3, 1958	Deepen entrance channel to 42 feet from gulf to outer end of jetty; 40 feet in all other deep-water channels and basins except undredged northward extension to inner basin at Harbor Island and branch channel to LaQuinta; and widen Industrial Channel to 400 feet with flared entrances to Corpus Christi and Avery Point turning basins.	H. Doc. 361, 85th Cong., 2nd Sess.
	Jul. 3, 1958	Channel 40 by 200 feet extending 2.2 miles from Tule Lake turning basin to a turning basin 40 feet deep, 700 to 900 feet wide, 1,000 feet long at Viola, Texas.	H. Doc. 361, 85th Cong., 2nd Sess.
	Jul. 3, 1958	Depth of 12 feet and a width of 100 feet in locally dredged Jewel Fulton Canal from LaQuinta Channel to a turning basin 12 by 200 by 400 feet, and assumption of maintenance by United States.	H. Doc. 361, 85th Cong., 2nd Sess.
	Jul. 14, 1960 (As amended by Dec. 31, 1970)	Construction of a breakwater at entrance to harbor area at Port Aransas, and realignment of existing 12-foot by 100-foot project channel.	Sec. 107, PL-86-645
	Aug. 13, 1968	Provides for a project depth of 45 feet in the existing deep-draft channels and basins, for construction of a new deep-draft turning point, for construction of a deep draft mooring area and mooring facilities and for widening of the channels and basins at certain locations. The Act also deauthorized the undredged northward extension of Inner Basin at Harbor Island and the undredged west turnout (Wye connection) between the LaQuinta Channel and the main channel of the waterway.	S. Doc. 99, 90th Cong., 2nd Sess. ¹
	Oct. 22, 1976	Modified local cooperation requirements for 1968 Act. Shifted responsibility for cost of disposal areas and confinement works from sponsor to joint 75 percent Federal and 25 percent non-Federal responsibility.	Sec. 124, PL 94-587

TABLE 40-B AUTHORIZING LEGISLATION

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
CORPUS CHRISTI SHIP CHANNEL, TX (Continued)			
Sep. 15, 1994		Assume maintenance of 17-foot by 100-foot Jewel Fulton Canal, after construction by local interest.	Sec. 204, PL 99-662 as amended
Nov 8, 2007		Deepen and widen Corpus Christi Ship Channel from Viola Turning Basin to the end of the jetties in the Gulf of Mexico to -52 feet MLT; deepen the remainder of the channel into the Gulf of Mexico to -54 feet MLT; widen the upper and Lower Bay reaches to 530 feet. Construct barge shelves 200 feet wide and -12 feet MLT on both sides of the CCSC from its junction with the LaQuinta Channel to the entrance of the Inner Harbor. Extend the LaQuinta Channel approximately 1.4 miles beyond its current limit, at a depth of -39 feet MLT. The channel will measure 400 feet wide and include a second turning basin with a diameter of 1200 feet, to a depth of -39 feet MLT. The existing LaQuinta Channel will remain at the 45 foot depth. Adjacent to the CCSC in the Lower Bay reach of the channel, mitigate project impacts by creation of 15 acres of sea grass adjacent to the LaQuinta. Construct two ecosystem restoration features, including rock breakwaters and geotubes to protect 1,200 acres of an existing high quality, complex wetland ecosystem and protect 40 acres of highly productive sea grass. In carrying out the project, the Secretary shall enforce the navigational servitude in the Corpus Christi Ship Channel (including the removal or relocation of any facility obstructing the project) consistent with the cost sharing requirement of Section 01 of the Water Resources Development Act of 1986 (33 U.S.C. 2211).	Sec.1001 (40), PL 110-114
7.	FREEMPORT HARBOR, TX		
Mar. 3, 1899		Dredging and other work necessary in judgment of Secretary of War for improving harbor; for taking over jetties and privately built works at mouth of river.	Specified in Act.
Mar. 2, 1907		Examination authorized. Work later confined to maintenance of jetties.	H. Doc. 1087, 60th Cong., 2nd Sess.
Feb. 27, 1911		Repairs to jetties and dredging.	Specified in Act.
Mar. 4, 1913		Construct seagoing hopper dredge.	Specified in Act.
Aug. 8, 1917		Purchase of one 15-inch pipeline dredge and equipment, its operation of 3 years, operation of seagoing dredge one-half time for 3 years, and repairs to jetties.	Specified in Act.
Mar. 3, 1925 ⁶		Diversion dam, diversion channel, and necessary auxiliary works.	Rivers and Harbors Committee Doc. 10, 68th Cong., 2nd Sess.
Jul. 3, 1930		Maintenance of diversion channel at expense of local interest.	Rivers and Harbors Committee Doc. 18, 70th Cong., 1st Sess.
Aug. 30, 1935		Deepening channels and basins.	Rivers and Harbors Committee Doc. 15, 72nd Cong., 1st Sess.

TABLE 40-B **AUTHORIZING LEGISLATION**

GALVESTON HARBOR AND CHANNEL, TX (Continued)			
	Mar. 2, 1907 ⁹	Extension of Galveston Channel from 51st to 57th Sts., with depth of 30 feet and width of 700 feet.	H. Doc. 768, 59th Cong., 2nd Sess.
	Jun. 25, 1910 ⁹	Conditional extension of Galveston Channel between 51st and 57th Sts., 30 feet deep and 1,000 feet wide.	H. Doc. 328, 61st Cong., 2nd Sess
	Jul. 27, 1916	Extend seawall at Galveston from angle at 6th St., and Broadway to vicinity of Fort San Jacinto.	H. Doc. 1390, 62nd Cong., 3rd Sess.
	Jul. 18, 1918	Deepen harbor channel to 35 feet and widen to 800 feet.	H. Doc 758, 65th Cong., 2nd Sess.
	Sep. 22, 1922	Further extension of seawall at Galveston to a junction with south jetty; and repairing seawall in front of Fort Crockett reservation.	H. Doc. 693, 66th Cong., 2nd Sess.
	Jan. 21, 1927 ¹¹	Deepen Galveston Channel to 32 feet; and maintain Galveston Harbor channels to dimensions of 800 feet wide, 35 feet deep on outer bar and 34 feet deep in inner bar. ¹⁰	H. Doc. 307, 69th Cong., 1st Sess.
	Aug 30, 1935	Maintain State Highway Ferry Landing Channels to dimensions of 12 by 100 feet.	River and Harbors Committee Doc. 31, 72 nd Cong. 1 st Sess.
	Aug 30, 1935	Construct 13 groins along gulf shore from 12 th to 61 st Sts. in city of Galveston at a limited cost of \$234,000 (10 Groins constructed)	H. Doc. 400, 73 rd Cong., 2 nd Sess.
	Aug. 30, 1935	Deepen Galveston Channel to 34 feet (Bolivar Roads to 43rd St.).	Rivers and Harbors Committee Doc. 61, 74th Cong., 1st Sess.
	Aug. 30, 1935	Deepen Galveston entrance channel to 36 feet.	Rivers and Harbors Committee Doc. 57, 74th Cong., 1st Sess.
	Apr. 4, 1938	Completion of project for construction of 13 groins.	PL 463, 75th Cong.
	Jun. 30, 1948	Deepen Galveston Harbor to 38 feet from gulf to a point 2 miles west of seaward end of north jetty; thence 36 feet to Bolivar Roads; revoking authority for maintenance of ferry channels; and Galveston channel to 36 feet deep from Bolivar Roads to 43rd Street.	H. Doc. 561, 80th Cong., 2nd Sess.
	May 17, 1950	Deepen outer bar channel to 38 feet from gulf to a point within jetties, thence 36 feet in authorized channels to and including upper turning basin.	H. Doc. 195, 81st Cong., 1st Sess.
	Jul. 3, 1958	Dredge to a depth of 42 feet over the authorized width of 800 feet from the Gulf of Mexico to a point 2 miles west of the seawall and of the North jetty thence at a depth of 40 feet to the junction of the Houston Ship Channel, with widths of 800 feet to Bolivar Roads, thence decreasing to 400 feet at the junction with the Houston Ship Channel.	H. Doc. 350, 85th Cong., 2nd Sess.
	Jun. 23, 1971 (House Res.) Nov. 18, 1971 (Senate Res.)	Deepen Galveston Channel to 40 feet from Bolivar to 43rd Street.	H. Doc. 121, 92 nd Cong

GALVESTON, TX, DISTRICT

TABLE 40-B **AUTHORIZING LEGISLATION**

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
GALVESTON HARBOR AND CHANNEL, TX (Continued)			
	Oct. 12, 1996	Provides for navigation and environmental restoration improvements. The navigation improvements consist of deepening and widening the Entrance Channel to 47 feet deep and 800 feet wide; the Houston Ship Channel to 45 feet deep and 530 feet wide; and the Galveston Channel to 45 feet deep. The environmental restoration portion consist of initial construction of marsh habitat and a colonial water bird nesting island through the beneficial use of new work dredged material, and incremental development (deferred construction) of additional marsh over the life of the navigation project through the beneficial use of maintenance materials dredged from Galveston Bay. The project is referred to as Houston-Galveston Navigation Channels.	Sec. 101 (30) PL 104-303
9.	GULF INTRACOASTAL WATERWAY BETWEEN APALACHEE BAY, FL AND MEXICAN BORDER		
	Mar. 2, 1907	Channel 4 by 100 feet from West Galveston Bay across Chocolate Bay to 4 feet of water in Chocolate Bay.	H. Doc. 445, 56th Cong., 1st Sess.
	Mar. 3, 1925	Channel 9 by 100 feet, Sabine River to Galveston Bay, and a 20-inch pipeline dredge. Such passing places, widening at bends, locks or guard locks and railway bridges over artificial cuts as are necessary.	H. Doc. 238, 68th Cong., 1st Sess.
	Jan. 21, 1927	Channel 9 by 100 feet, Galveston Bay to Corpus Christi.	H. Doc. 238, 68th Cong., 1st Sess.
	Aug. 26, 1937	Maintenance of a flood-discharge channel in Colorado River.	S. Committee print, 75th Cong., 1st Sess.
	Jun. 20, 1938 ¹³	Channel 9 by 100 feet in San Bernard River, Texas.	H. Doc. 640, 75th Cong., 3rd Sess.
	Jun. 20, 1938	Channel in Colorado River, 9 by 100 feet, with basin.	H. Doc. 642, 75th Cong., 3rd Sess.
	Jun. 20, 1938	Channel 9 by 100 feet from Palacios through Trepalacios and Matagorda Bays.	H. Doc. 564, 75th Cong., 3rd Sess.
	Jun. 20, 1938	Channel 9 by 200 feet from main channel to harbor at Rockport and improve harbor to 9-foot depth.	H. Doc. 641, 75th Cong., 3rd Sess.
	Jun. 20, 1938	Channel 6 by 100 feet from main channel to Aransas Pass, Texas.	H. Doc. 643, 75th Cong., 3rd Sess.
	Mar. 23, 1939	Enlarge waterway to depth of 12 feet and a width of 125 feet from Sabine River to Corpus Christi.	H. Doc. 230, 76th Cong., 1st Sess.
	Jul. 23, 1942	Construct waterway from Corpus Christi to vicinity of Mexican border to provide a depth of 12 feet and width of 125 feet throughout.	PL 675, 77th Cong.
	Mar. 2, 1945	Channel 6 by 60 feet from GIWW to a point in Chocolate Bayou near Liverpool.	H. Doc. 337, 76th Cong., 1st Sess.
	Mar. 2, 1945 ⁹	Channel 6 feet deep and 60 feet wide from main channel near Port O'Connor, Texas, in Barroom Bay.	H. Doc. 428, 76th Cong., 1st Sess.

TABLE 40-B AUTHORIZING LEGISLATION

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
GULF INTRACOASTAL WATERWAY (continued)			
	Mar. 2, 1945	Enlarge channel from main channel to Aransas Pass, Texas, providing a depth of 9 feet and width of 100 feet.	H. Doc. 383, 77th Cong., 1st Sess.
	Mar. 2, 1945	Channel 12 by 125 feet from main channel to Red Fish Landing, Texas, with basin.	S. Doc. 248, 78th Cong., 2nd Sess.
	Mar. 2, 1945 ¹⁴	Channel 12 feet deep and 125 feet wide from main channel to vicinity of Harlingen, Texas, via Arroyo Colorado with basin.	H. Doc. 402, 77th Cong., 1st Sess. (See PL 14, 79th Cong.)
	Jul. 24, 1946	Fill a portion of shallow-draft channel adjacent to Port Isabel Turning Basin, construct a channel to connect shallow-draft channel with main channel near shoreline of Laguna Madre, and enlarge shallow-draft channel west of this connection, all to 12-foot depth and bottom width of 125 feet.	H. Doc. 627, 79th Cong., 2nd Sess.
	Jul. 24, 1946	Reroute main channel to north shore of Red Fish Bay between Aransas Bay and Corpus Christi Bay; deepen tributary channel from Port Aransas to Aransas Pass, Texas, 12 feet and extended basin at same depth.	H. Doc. 700, 79th Cong., 2nd Sess.
	May 17, 1950	Deauthorized 6 by 60 foot channel in Chocolate Bayou and reauthorized the 4 by 100-foot channel.	H. Doc. 768, 80 th Cong., 2nd Sess.
	May 17, 1950	Alternate channel across South Galveston Bay between Port Bolivar and Galveston causeway.	H. Doc. 196, 81st Cong., 1st Sess.
	May 17, 1950	“Red Fish Landing” changed to “Port Mansfield, Texas.”	PL 516, 81st Cong.
	Jul. 12, 1952	Incorporate as part of Intracoastal Waterway a channel 9 by 100 feet from main channel via Seadrift to point on Guadalupe River 3 miles above Victoria, Texas, authorized by River and Harbor Act of 1945.	PL 527, 82nd Cong., 2nd Sess.
	Sep. 3, 1954 ¹⁵	Small craft harbor 9 by 200 by 1,000 feet at Seadrift with an entrance channel 9 by 100 feet.	H. Doc. 478, 81st Cong., 2nd Sess.
	Sep. 3, 1954	Widen tributary channel between Port Aransas and Aransas Pass, Texas, to 125 feet; straighten and widen to 125 feet connecting channel to Conn Brown Harbor, and maintain Conn Brown Harbor at Federal expense, all to 12 feet deep.	H. Doc. 376, 83rd Cong., 2nd Sess.
	Sep. 9, 1959	Improve channels and basins comprising channel to Port Mansfield constructed in part by Federal Government and in part by local interest; constructing turnout curves at Gulf Intracoastal Waterway intersection and bend easing at entrance to turning basin; construct parallel jetties at gulf entrance; maintenance of locally dredged jetty channel 16 by 250 feet; and maintenance of small craft basin.	S. Doc. 11, 86th Cong., 1st Sess.
	Jul. 14, 1960	Entrance channel 7 feet deep by 75 feet wide from main channel to Gulf of Mexico to inside shoreline at Port Isabel, Texas, an inner channel 6 feet deep by 50 feet wide from entrance channel to East Harbor Basin, and an irregular-shaped harbor basin 6 feet deep having a surface area of about 7 acres.	Sec. 107, PL 645, 86th Cong.
	Jul. 14, 1960 (As amended Dec. 31, 1970)	Deepen the existing 6-foot channel at Port Isabel to 12 feet and removing the submerged bars at each end of the island to a depth of -12 feet MLT.	Sec. 107, PL 86-645

TABLE 40-B

AUTHORIZING LEGISLATION

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
GULF INTRACOASTAL WATERWAY (continued)			
	Jul. 14, 1960 (As amended Dec. 31, 1970)	Deepening the existing channel to 12 by 125 feet, and extend southeasterly from the Gulf Intracoastal Waterway main channel in West Galveston Bay, into Offatts Bayou, a distance of 2.2 miles, and a west turnout 12 by 125 feet between the proposed Offatts Bayou Channel and the Gulf Intracoastal Waterway.	Sec. 107, PL 86-645
	Jul. 14, 1960 (As amended Dec. 31, 1970)	Deepening Aransas Pass tributary channel to 14 feet from mile 0 at Harbor Island to mile 6.1 at the city of Aransas Pass; widening to 175 feet between miles 3.5 and 4.6; and deepening Conn Brown Harbor, turning basin and connecting channel between Conn Brown Harbor and turning basin.	Sec. 107, PL 86-645
	Oct. 23, 1962 ¹⁶	Improve main channel 16 feet deep and 150 feet wide from Sabine River to Houston Ship Channel; with two relocations; relocate main channel in Matagorda Bay and Corpus Christi Bay; and maintaining existing Lydia Ann Channel.	H. Doc. 556, 87th Cong., 2nd Sess.
	Oct. 23, 1962	Deepen and widen channel to Palacios; construct two protective breakwaters; maintain and deepen existing basins; and deepen, enlarge and maintain existing approach channel to basin No. 2.	H. Doc. 504, 87th Cong., 2 nd Sess.
	Oct. 23, 1962	Eliminates requirement of local interest to construct bridge at mile 29.2 turning basin at Victoria, and maintain turning basins at Victoria and Seadrift; provide: Federal construction of vertical-lift railroad bridge at Missouri-Pacific Railroad mainline crossing, mile 29.2; construction and future maintenance of basin near Victoria, Texas, and maintenance of basin constructed by local interests at Seadrift, Texas.	H. Doc. 288, 87th Cong., 2nd Sess.
	Oct. 27, 1965 ¹⁷	Modify existing Federal navigation project to provide a channel extending from Gulf Intracoastal Waterway through Chocolate Bay and Chocolate Bayou to project channel mile 8.2, thence to a turning basin near channel mile 13.2 and for salt water barrier in Chocolate Bayou about 3.7 miles upstream from basin (channel mile 16.9).	H. Doc. 217, 89th Cong., 1st Sess.
	Aug. 13, 1968	Entrance channel 15 feet deep and 200 feet wide at the mouth of Colorado River Channel protected by an east jetty 3,500 feet long extending to 12-foot depth and a west jetty 2,900 feet long extending to 5-foot contour; make channel 12 feet by 100 feet from gulf shore to Matagorda, including recreation facility, a turning basin 12 feet by 300 feet wide and 1,450 feet long, and a new diversion channel 250 feet wide and varying in depth from 20 to 23 feet including a closure dam across the present river channel.	S. Doc. 102, 90th Cong., 2nd Sess.
	Nov. 17, 1986	Modified 1968 authorization to provide that diversion features be constructed at Federal expense and operation and maintenance be shared 75 percent Federal and 25 percent non-Federal.	Sec. 812, PL 99-662
	Nov. 17, 1988	Enlarge existing Channel to Victoria from a depth of 9 feet and width of 100 feet to a depth of 12 feet and width of 125 feet.	Sec. 3, PL 100-676
	Oct. 31, 1992	Provide 8 miles of erosion protection for the existing waterway in the vicinity of Sargent, Texas.	Sec. 101 (20), PL 102-580

TABLE 40-B AUTHORIZING LEGISLATION

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
GULF INTRACOASTAL WATERWAY (continued)			
	Oct. 12, 1996	Provides for erosion protection along a 31-mile reach of the Gulf Intracoastal Waterway, which crosses the critical wintering habitat of the endangered whooping crane, including a 13.25-mile reach within the boundary of the Aransas National Wildlife Refuge. Also, provides for limited oil spill containment features and equipment to protect those areas from accidental hazardous spills.	Sec. 101 (29), PL 104-303
10.	HOUSTON-GALVESTON NAVIGATION CHANNELS, TX		
	Oct. 12, 1996	Provides for navigation and environmental restoration improvements. The navigation improvements consist of deepening and widening the Entrance Channel to 47 feet deep and 800 feet wide; the Houston Ship Channel to 45 feet deep and 530 feet wide; and the Galveston Channel to 45 feet deep. The environmental restoration portion consist of initial construction of marsh habitat and a colonial water bird nesting island through the beneficial use of new work dredged material, and incremental development (deferred construction) of additional marsh over the life of the navigation project through the beneficial use of maintenance materials dredged from Galveston Bay.	Sec. 101 (29) PL 104-303
	Nov. 8, 2007	Reroute the portion of the existing GIWW across Matagorda Bay, between mile marker 460 and 472, approximately 6,000 feet north of an parallel to the existing alignment, along the Gulf Intracoastal Waterway, Brazos River to Port O'Connor, Matagorda Bay Reroute. The channel will have a depth of 12 feet and a bottom width of 125 feet, the same as the existing channel. In the vicinity of bends in the channel, the bottom width will average 300 feet. Beneficial use of dredged material will provide for the construction of approximately 135 acres of marsh at Palacios Point and 160 acres of marsh near Port O'Connor and also nourish beaches at Sundown Island and the beach at Port O'Connor. The cost of construction to be paid for ½ from amounts appropriated from the general fund of the Treasury and ½ from amounts appropriated from the Inland Waterways Trust Fund.	Sec. 1001 (41), PL 110-114
	Nov. 8, 2007	Along the Gulf Intracoastal Waterway, High Island to Brazos River construct a 24-acre sediment trap at Rollover Pass, widen the west approach opening at Sievers Cove from 125 feet to 200 feet. Abandon the existing turning Channel of the Texas City Wye, widen the Texas City Channel at the intersection with the GIWW; remove navigational aids. Widen the Pelican Island Mooring Basin on the north side from 75 feet to 155 feet and combine this feature with the Texas City Wye. Construct a single 24-foot circumference, 10,000-foot long geotube barrier between the GIWW and the West Bay. The cost of construction to be paid for ½ from amounts appropriated from the general fund of the Treasury and ½ from amounts appropriated from the Inland Waterways Trust Fund.	Sec. 1001 (42), PL 110-114
11.	HOUSTON SHIP CHANNEL, TX		
	Mar. 5, 1905	Easing or cutting off sharp bends and construction of a pile dike. ¹⁸	Rivers and Harbors Committee Doc. 35, 61st Cong., 2nd Sess.
	Mar. 2, 1919	A channel 30 feet deep, widen bend at Manchester and enlarge turning basin.	H. Doc. 1632, 65th Cong., 3rd Sess.
	Mar. 3, 1925	A light-draft extension of channel to mouth of White Oak Bayou. ¹⁹	H. Doc. 93, 67th Cong., 1st Sess.

GALVESTON, TX, DISTRICT

TABLE 40-B **AUTHORIZING LEGISLATION**

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
HOUSTON SHIP CHANNEL, TX (Continued)			
	Jul. 3, 1930	Widen channel through Morgan Point and to a point 4,000 feet above Baytown and widen certain bends.	H. Doc. 13, 71st Cong., 1st Sess.
	Aug. 30, 1935 ¹¹	Deepen to 32 feet in main channel and turning basin, and a 400-foot width through Galveston Bay.	Rivers and Harbors Committee Doc. 28, 72nd Cong., 1st Sess.
	Aug. 30, 1935	Deepen to 34 feet in main channel and widen from Morgan Point to turning basin	Rivers and Harbors Committee Doc. 58, 74th Cong., 1st Sess.
	Mar. 2, 1945	Branch channel 10 by 60 feet behind Brady Island.	H. Doc. 226, 76th Cong., 1st Sess.
	Mar 2, 1945	Widen channel from Morgan Point to lower end of Fidelity Island with turning points at mouth of Hunting Bayou and lower end of Brady Island.	H. Doc. 226, 76th Cong., 1st Sess.
	Mar. 2, 1945	Widen channel from lower end of Fidelity Island to Houston turning basin and dredge off-channel silting basins.	H. Doc. 737, 79th Cong., 2nd Sess.
	Jun. 30, 1948	Deepen to 36 feet from Bolivar Roads to and including main turning basin at Houston, Texas, including turning points at Hunting Bayou and Brady Island.	H. Doc. 561, 80th Cong., 2nd Sess.
	Jul. 3, 1958 ²⁰	Deepen to 40 feet from Bolivar Roads to Brady Island, construct Clinton Island turning basin, a channel 8 by 125 feet at Five Mile Cut, and improve shallow-draft channel at Turkey Bend.	H. Doc. 350, 85 th Cong., 2nd Sess. ¹
	Jul. 14, 1960	Barbour Terminal at Morgan Point.	Sec. 107, PL 86-645
	Oct. 27, 1965H. Doc. 257, 89th Cong., 1st Sess.	Restoring existing locally dredged channel from mile 0 to 0.34 to 36 feet deep and dredging a 15-12 ft. channel from mile 0.34 to 2.81, in Greens Bayou. ²¹	H. Doc. 257, 89th Cong., 1st Sess.
	Nov. 17, 1986	Maintenance of Greens Bayou, Barbour Terminal Channel, and Bayport Ship Channel to forty-foot depths at Federal expense.	Sec. 819, PL 99-662
	Oct. 12, 1996	Provides for navigation and environmental restoration improvements. The navigation improvements consist of deepening and widening the Entrance Channel to 47 feet deep and 800 feet wide; the Houston Ship Channel to 45 feet deep and 530 feet wide; and the Galveston Channel to 45 feet deep. The environmental restoration portion consist of initial construction of marsh habitat and a colonial water bird nesting island through the beneficial use of new work dredged material, and incremental development (deferred construction) of additional marsh over the life of the navigation project through the beneficial use of maintenance materials dredged from Galveston Bay. The project is referred to as Houston-Galveston Navigation Channels.	Sec. 101 (30) PL 104-303

12.		MATAGORDA SHIP CHANNEL, TX	
	Jun. 25, 1910	Channel to Port Lavaca, Texas 7 feet deep and 89 feet bottom width.	H. Doc. 1082, 60th Cong., 2nd Sess.
	Aug. 30, 1935	Extend 7-foot channel to shoreline of Lavaca Bay at mouth of Lynns Bayou.	Rivers and Harbors Committee Doc. 28, 74th Cong., 1st Sess.
	Aug. 26, 1937	Deepen and widen channel to present project dimensions.	Rivers and Harbors Committee Doc. 37, 75th Cong., 1st Sess.
	Mar. 2, 1945	Extend channel 6 by 100 feet from Port Lavaca via Lavaca Bay, Lavaca and Navidad Rivers to Red Bluff, a distance of 20 miles.	H. Doc. 314, 76th Cong., 1st Sess.
	Mar. 2, 1945	A harbor of refuge 9 feet deep near Port Lavaca and an approach channel 100 feet wide and equal depth.	H. Doc. 731, 79th Cong., 2nd Sess.
	Jul. 3, 1958	Deepen to 12 feet and widen to 125 feet Port Lavaca Channel and approach channel to harbor of refuge; deepen to 12 feet Port Lavaca turning basin and basins at harbor of refuge.	H. Doc. 131, 84th Cong., 1st Sess.
	Jul. 3, 1958	An entrance channel 38 by 300 feet, a channel 36 by 200 feet, 22 miles long across Matagorda and Lavaca Bays to Point Comfort, Texas, a turning basin 36 feet deep and 1,000 feet square at Point Comfort, and dual jetties at entrance from gulf.	H. Doc. 388, 84th Cong., 2nd Sess.
13.		NECHES RIVER AND TRIBUTARIES, SALT WATER BARRIER AT BEAUMONT, TX	
	Oct. 22, 1976	Construct gated salt water barrier in Neches River consisting of seven 40 x 24.5 foot tainter gates; gated navigation by-pass channel with clear opening of 56 feet and depth of 16 feet; access road and levee; and auxiliary dam across canal which drains adjacent bayou.	Sec. 102, PL 94-587
14.		SABINE-NECHES WATERWAY, TX.	
	Jul. 25, 1912	Existing project dimensions of jetties, a 26-foot channel through Sabine Pass, Port Arthur Canal and Port Arthur turning basin; and a 26-foot turning basin at Port Arthur. A depth of 25-feet in Sabine-Neches Canal, Neches River to Beaumont and Sabine River to Orange, including cutoffs and widening channels.	H. Doc. 773, 61st Cong., 2nd Sess.
	Sep. 22, 1922	Deepen channels to 30 feet from gulf to Beaumont, with increased widths and an anchorage basin in Sabine Pass.	H. Doc. 975, 66th Cong., 3rd Sess.
	Sep. 22, 1922	Deepen Port Arthur east and west turning basins and approach channel to 30 feet. Take over and deepen to 30 feet channel connecting west turning basin with Taylors Bayou turning basin. For a 30-foot depth in channel from mouth of Neches River to cutoff in Sabine River near Orange.	S. Doc. 152, 67th Cong., 2nd Sess.
	Mar. 3, 1925	Removal of guard lock in Sabine-Neches Canal.	H. Doc. 234, 68th Cong., 1st Sess.

TABLE 40-B **AUTHORIZING LEGISLATION**

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
SABINE-NECHES WATERWAY, TX (Continued)			
	Jan. 21, 1927	Widen Sabine Pass and jetty channel, Port Arthur Canal, and Sabine-Neches Canal. For dredging 2 passing places in Sabine-Neches Canal, easing of bends, removal and reconstructing Port Arthur field office, extending Beaumont turning basin upstream 200 feet above new city wharves, and an anchorage basin in Sabine Pass.	H. Doc 287, 69th Cong., 1st Sess.
	Aug. 30, 1935 ¹¹	A depth of 32 feet in channels from gulf to Beaumont turning basin, including all turning basins at Port Arthur.	Rivers and Harbors Committee Doc. 27, 72nd Cong., 1st Sess.
	Aug. 30, 1935 ¹¹	Deepen channels to 34 feet with increased widths from gulf to Beaumont turning basin.	Rivers and Harbors Committee Doc. 12, 74th Cong., 1st Sess.
	Aug. 30, 1935	Construct suitable permanent protective works along Sabine Lake. Maintain Taylors Bayou turning basin.	Specified in Act.
	Aug. 26, 1937	Maintain channel from Sabine River to Orange Municipal wharf.	Rivers and Harbors Committee Doc. 3, 75th Cong., 1st Sess.
	Aug. 26, 1937	Dredging 500 feet from eastern end of Harbor Island and abandonment of channel south and west of Harbor Island.	Rivers and Harbors Committee Doc. 20, 75th Cong., 1st Sess.
	Jun. 20, 1938 ²²	Increased widths of channels from gulf to Beaumont turning basin and channel connecting Port Arthur west turning basin and Taylors Bayou turning basin, deepen Beaumont turning basin and Beaumont turning extension to 34 feet; and dredge a new cutoff from Smith's Bluff cutoff to McFadden Bend.	H. Doc. 581, 75th Cong., 3rd Sess.
	Oct. 17, 1940	Abandon Orange turning basin; dredge a channel 25 by 150 feet, suitably widened on bends to highway bridge, and dredge a cutoff channel opposite Orange.	S. Doc 14, 77th Cong., 1st Sess.
	Mar. 2, 1945	Extend Beaumont turning basin upstream 300 feet.	H. Doc. 685, 76th Cong., 3rd Sess.
	Mar. 2, 1945	Widen Port Arthur west turning basin to 600 feet.	S. Doc 60, 77th Cong., 1st Sess.
	Mar. 2, 1945	Dredge a channel from Beaumont turning basin to vicinity of Pennsylvania Shipyard.	S. Doc 158, 77th Cong. 2nd Sess.

TABLE 40-B AUTHORIZING LEGISLATION

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
SABINE-NECHES WATERWAY, TX (continued)			
	Jul. 24, 1946 ²³	Deepen Sabine Pass outer bar channel to 37 feet, Sabine Pass jetty channel to 36 feet at inner end, deepen to 36 feet Sabine Pass Channel, Port Arthur Canal, Port Arthur east and west turning basins, Taylors Bayou turning basin and channel from Port Arthur west turning basin to Taylors Bayou turning basin, deepen to 36 feet and widen to 400 feet Sabine-Neches Canal from Port Arthur Canal to mouth of Neches River except through Port Arthur Bridge; deepen Neches River channel from mouth to Beaumont turning basin to 36 feet widening to 350 feet from Smith's Bluff to Beaumont turning basin; deepen junction area on Neches River at Beaumont turning basin to 36 feet; and widen Sabine-Neches Canal between Neches and Sabine Rivers to 150 feet.	H. Doc. 571, 79th Cong., 2nd Sess.
	Jul. 24, 1946 ²⁴	Improve Cow Bayou, Texas, by construction of a channel 100 feet wide and 13 feet deep extending from navigation channel in Sabine River to a point 0.5 mile above county bridge at Orangefield, Texas, with a turning basin.	H. Doc. 702, 79th Cong., 2nd Sess.
	Jul. 24, 1946	Improve Adams Bayou, Texas, to provide a channel 12 feet deep and 100 feet wide extending from 12-foot depth in Sabine River to first county highway bridge across bayou.	H. Doc. 626, 79th Cong., 2nd Sess.
	May 17, 1950	Deepen to 36 feet and widen to 400 feet the Sabine-Neches Canal near Port Arthur bridge; reconstruct Port Arthur Bridge and relocate Port Arthur field office.	H. Doc. 174, 81st Cong., 1st Sess.
	Sep. 3, 1954 ²⁵	Rectification of certain reaches of existing Sabine Pass Channel, Sabine-Neches Canal, and Neches River and Sabine River Channel; widen to 350 feet entrance channel to Port Arthur turning basins; widen curve at junction of Port Arthur and Sabine-Neches Canals; relocate and enlarge Sabine Pass anchorage basin to 34 by 1,500 by 3,000 feet; widen to 200 feet Sabine-Neches Canal from mouth of Neches River to mouth of Sabine River and Sabine River Channel to upper end of existing project at Orange, except for channel around Harbor Island at Orange; deepen to 30 feet Sabine River Channel from cutoff near Orange municipal slip to upper end of project, except around Harbor Island; and enlarge area at entrance to Orange municipal slip to provide a maneuvering basin.	S. Doc. 80, 83rd Cong., 2nd Sess.
	Oct. 23, 1962 ²⁶	Improve outer bar channel to 42 and 40 feet for all inland channels to Port Arthur and Beaumont; width of 500 feet in Port Arthur Canal and 400 feet in Neches River Channel to Beaumont with three turning points in Neches River; a channel, 12 by 125 feet, extending in Sabine River to Echo; and replace an obstructive bridge at Port Arthur, Texas. Deauthorization of uncompleted portion of channel between Port Arthur west turning basin and Taylors Bayou turning basin and enlargement of entrance channel to Port Arthur turning basins.	H. Doc. 553, 87th Cong., 2nd Sess. ¹
15.	TEXAS CITY CHANNEL, TX		
	Mar. 4, 1913	A channel 300 by 30 feet and construct a pile dike 28,200 feet long north to channel.	H. Doc. 1390, 62nd Cong., 3rd Sess.
	Jul. 3, 1930	A harbor 800 by 30 feet at Texas City, and construct a rubblemound dike.	H. Doc. 107, 71st Cong., 1st Sess.

TABLE 40-B **AUTHORIZING LEGISLATION**

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
---------------------------	----------------------------	-----------------------------	-----------

TEXAS CITY CHANNEL, TX (Continued)

	Aug. 30, 1935 ¹¹	Extension of rubblemound dike to shoreline.	Rivers and Harbors Committee Doc. 4, 73rd Cong., 1st Sess.
	Aug. 30, 1935	Deepen channel and harbor to 32 feet.	Rivers and Harbors Committee Doc. 46, 73rd Cong., 2 nd Sess.
	Aug. 30, 1935	Deepen channel and harbor to 34 feet.	Rivers and Harbors Committee Doc. 62, 74th Cong., 1st Sess.
	Aug. 26, 1937	Extend harbor 1,000 feet southward, 800 by 34 feet.	Rivers and Harbors Committee Doc. 47, 75th Cong., 1st Sess.
	Jun. 30, 1948	Deepen channel and harbor to 36 feet, widen channel to 400 feet and harbor to 1,000 feet and changing name of project to "TEXAS CITY CHANNEL, TEXAS."	H. Doc. 561, 80th Cong., 2nd Sess. ¹
	Jul. 14, 1960	Deepen channel and turning basin to 40 feet and construct 16-foot Industrial Barge Canal.	H. Doc. 427, 86th Cong., 2nd Sess.
	Oct. 12, 1972 Senate Res.)	Widen the existing main turning basin to 1,200 feet including relocation of the basin 85 feet to the east; providing a 40-foot deep channel in the Industrial Canal at widths of 300-400 feet, with a turning basin at the head of the canal 40 feet deep, 1,150 feet long, and 1,000 feet wide, and easing of the bend at the entrance to the canal, and deauthorization of shallow-draft Industrial Barge Canal not incorporated in the plan of improvement above.	H. Doc. 199, 92 nd Cong., 2nd Sess. (Sec. 201, PL 89-298)
	Oct. 12, 1972 (House Res.)		
	Nov. 17, 1986	Deepening the Texas City Turning Basin to 50 feet, enlarging the 6.7 mile long Texas City Channel to 50 feet by 600 feet; deepening the existing 800-foot wide Bolivar Roads Channel and Inner Bar Channel to 50 feet; deepening the existing 800-foot wide Outer Bar and Galveston Entrance Channels to 52 feet; extending the Galveston Entrance Channel to a 52 foot depth for 4.1 miles at a width of 800 feet and an additional reach at a width of 600 feet to the 52 foot contour in the Gulf of Mexico; and establishment of 600 acres of wetland and development of water-oriented recreational facilities on a 90-acre enlargement of the Texas City Dike.	Sec. 201, PL 99-662

16. TRINITY RIVER AND TRIBUTARIES, TX

	Jun. 18, 1878	Dredging of a channel through the bar at the mouth of the Trinity River.	
	1889	Modified to include two parallel jetties 275 feet apart, the westerly one of length 7,359 feet and the other of length 300 feet.	
	Mar. 3, 1905	Authorized the Anahuac Channel. No project dimensions were specified by the Act, so a 7- by 8-foot channel, 12,238 feet long was dredged in 1905.	Specified in Act.

TABLE 40-B AUTHORIZING LEGISLATION

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
TRINITY RIVER AND TRIBUTARIES, TX (continued)			
	Sep. 22, 1922	Abandon improvements above Liberty and terminate all improvements by lock and dam, leaving a 6-foot channel from Liberty to mouth.	H. Doc. 989 66 th Cong., 3rd Sess
	Mar. 2, 1945	Provides for a navigable channel from the Houston Ship Channel near Red Fish Bar in Galveston and Trinity Bays to the mouth of Trinity River and 9 feet deep and 150 feet wide in the river section, with a turning basin at Liberty.	H. Doc. 403, 77th Cong., 1st Sess.
	Jul. 24, 1946	Modification of the project to provide for a channel 9 feet deep and 150 feet wide from the Houston Ship Channel near Red Fish Bar in Galveston Bay extending along the east shore of Trinity Bay to the mouth of the Trinity River at Anahuac, including protective spoil embankment on the bay side of the channel in lieu of the 9 by 200-foot channel in Galveston and Trinity Bays.	H. Doc. 634, 79th Cong., 2nd Sess.
	Oct. 23, 1962	Provides for the multiple-purpose Wallisville Reservoir, including a navigation lock in the Wallisville Dam at Channel Mile 28.30 and advancement of the Channel to Liberty from one mile below Anahuac (Mile 23.2) to the Texas Gulf Sulphur Company's slip at Channel Mile 35.8, and incorporation into existing project Anahuac Channel and mouth of Trinity River projects.	H. Doc. 215, 87th Cong., 1st Sess.
	Oct. 27, 1965	Reevaluation of navigation benefits.	H. Doc. 276, 89th Cong., 1st Sess.
	Jul. 30, 1983	Modified Wallisville Reservoir by reducing the size to 5,600 acres and confining the reservoir to east side of Trinity River.	PL 98-63
20.	BUFFALO BAYOU AND TRIBUTARIES, TX		
	Jun. 20, 1938	Barker and Addicks Reservoirs, Texas.	H. Doc. 456, 75th Cong., 2nd Sess.
	Sep. 3, 1954	Clearing, straightening, enlarging and lining of Buffalo, Brays, and White Oak Bayous.	H. Doc. 250, 83rd Cong., 2nd Sess. ¹
	Oct. 27, 1965	Extend upper limits of White Oak Bayou upstream about 2.1 miles from BRI RR bridge to mouth of Cole Creek.	H. Doc. 169, 89th Cong., 1st Sess.
	Nov. 28, 1990	Flood damage reduction improvements and recreational development for the Houston, Texas urban area, divided into six separable elements – Brays, Greens, Hunting, Halls, Carpenters and Little White Oak Bayous. Flood control improvements consist of 75.3 miles of stream enlargement, 14 miles of stream clearing, 7 flood detention basins, 7 miles of diversion channels and environmental revegetation. Recreation features consist of 14.7 miles of trails, 502 picnic facilities, 12 group pavilions, 2 boat launching ramps, 10 restrooms, playgrounds, exercise stations and parking facilities.	Sec. 101, PL 101-640

TABLE 40-B **AUTHORIZING LEGISLATION**

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
---------------------------	----------------------------	-----------------------------	-----------

BUFFALO BAYOU AND TRIBUTARIES, TX (Continued)

	Oct. 12, 1996	Authorizes non-Federal interests to undertake flood control projects in the United States, subject to obtaining any permits required pursuant to Federal and State laws in advance of actual construction. For the purpose of demonstrating the potential advantages and effectiveness of non-Federal implementation of flood control projects, the Secretary shall enter into agreements pursuant to this section with non-Federal interests for development of the following Buffalo Bayou projects: Brays Bayou, Hunting Bayou, and White Oak Bayou.	Sec. 211, PL 104-303
	Oct. 12, 1996	The non-Federal interest for the Buffalo Bayou and tributaries authorized flood control projects, may be reimbursed by up to \$5,000,000 or may receive a credit of up to \$5,000,000 toward required non-Federal project cost-sharing contributions for work performed by the non-Federal interest at each of the following locations if such work is compatible with 1 or more of the following authorized projects: White Oak Bayou, Brays Bayou, Hunting Bayou, Garners Bayou (not authorized), and the Upper Reach of Greens Bayou.	Sec 350, PL 104-303
	Nov. 8, 2007	Amends Section 211 (f) of Water Resources Development Act of 1996 to provide an alternative to the authorized Buffalo Bayou, Texas project, authorized by the first section of the River and Harbor Act of June 20, 1983 and modified by Section 3a of the Flood control Act of August 11, 1939.	Sec. 5157 (15), PL 110-114
	Nov. 8 2007	Amends Section 211 (f) of Water Resources Development Act of 1996 to provide an alternative to the authorized Halls Bayou, Texas project, authorized by Section 101(a)(21) of the Water Resources Development Act of 1990.	Sec. 5157 (16) PL 110-114

21. CLEAR CREEK, TX

	Aug. 13, 1968	Channel enlargement and rectification from upper end of Clear Lake at Mile 3.8 to improved channel Mile 34.8. ²⁸	H. Doc. 351, 90th Cong., 2nd Sess.
	Nov. 17, 1986	Modified local cooperation requirements of the 1968 authorization.	Sec. 1001, PL 99-662
	Aug. 17, 1999	Modified the project to authorize a nonstructural flood control project.	Sec. 355(a), PL 106-53

22. LOWER RIO GRANDE BASIN, TX

	Nov 17, 1986	Channel improvements to provide drainage protection for the area in Hidalgo and Willacy Counties north of U.S. Highway 83, and for the area between U.S. Highway 83 and the Rio Grande in Hidalgo County; and to provide flood protection for the cities of McAllen, Edinburg, Raymondville, Edcouch, La Villa, and Lyford.	Sec 401, PL 99-662
	Aug. 17, 1999	Modified the project to authorize a nonstructural flood control project.	Sec. 355(a), PL 106-53

TABLE 40-B AUTHORIZING LEGISLATION

See Section in Text	Date Authorizing Act	Project and Work Authorized	Documents
LOWER RIO GRANDE BASIN, TX (Continued)			
Nov. 8, 2007		Applies the Ability to Pay criteria and procedures in Section 103(m)(2) of the Water Resources Development Act of 1986 (33 U.S.C. 2213 (m) to the Lower Rio Grande Basin, Texas project.	Sec. 2019 (b) (2), PL 110-114
Nov. 8, 2007		Amends Section 401(a) of the Water Resources Development Act of 1986 to include as a part of the project flood protection works to reroute drainage to Raymondville Drain constructed by the non-Federal interest in Hidalgo County in the vicinity of Edinburg, Texas, if the Secretary determines that such work is feasible.	Sec. 3150, PL 110-114
		Credit the cost of planning, design, and construction work carried out by the non-Federal interest for the project before the date of the partnership agreement.	
26.		SIMS BAYOU, TX	
Nov. 17, 1986		Enlargement and rectification, with appropriate erosion control measures of 19.31 miles of Sims Bayou; environmental measures and riparian habitat along entire alignment, and recreational development.	Sec. 401, PL 99-662
Sep. 29, 1989		Amended the Water Resources and Development Act (WRDA) of 1986 authorization as project cost estimate had exceeded limit established in Section 902 of WRDA 1986.	Sec. 103, PL 101-101
32.		NORTH PADRE ISLAND, TX	
Aug. 17, 1999		Carry out a project for ecosystem restoration and storm damage reduction at North Padre Island, Corpus Christi Bay, Texas, if it is determined that the work is technically sound and environmentally acceptable.	Sec. 556, PL 106-53
Nov. 8, 2007		The project for ecosystem restoration and storm damage reduction, North Padre Island, Corpus Christi Bay, Texas, authorized by section 556 of the Water Resources Development Act of 1999 (113 Stat. 353) is modified to include recreation as a project purpose.	Sec. 3151, PL 110-114

<p>¹⁰ Deepening 43rd to 57th Streets was deauthorized under Sec. 12 of PL 93-251. (1975 Deauthorization list)</p>	<p>¹¹ Previously authorized September 6, 1933 by Public Works Administration.</p>	<p>²² Complete widening of channel between Port Arthur west turning basin and Taylors Bayou turning basin deauthorized by 1962 R&H Act.</p>
<p>¹² H. Doc. 230, 76th Cong., 1st Sess. and project documents contain latest published maps.</p>	<p>¹³ Dredging upper 3.4 miles was deauthorized under Sec. 12 of PL 93-251. (1975 Deauthorization list)</p>	<p>²³ Complete deepening of channel between Port Arthur west turning basin and Taylors Bayou turning basin deauthorized by 1962 R&H Act.</p>
<p>¹⁴ Dredging upper 5 miles was deauthorized under Sec. 1001 of PL 99-662.</p>	<p>¹⁵ Inactive.</p>	<p>²⁴ Channel extension above Cow Bayou turning basin near Orangefield was deauthorized under Sec. 12 of PL 93-251. (1975 Deauthorization list)</p>
<p>¹⁶ Portion of 16-foot by 150-foot channel from Sabine River to Houston Ship Channel is inactive. Relocation of channel in Matagorda Bay deauthorized under Sec. 12 of PL 93-251. (1986 Deauthorization list)</p>	<p>¹⁷ The 9 feet by 100 feet channel from Mile 8.2 to Mile 13.2 in Chocolate Bayou was deauthorized under Sec. 1001 of PL 99-662.</p>	<p>²⁵ Widening to 350 feet entrance channel to Port Arthur turning basin deauthorized by 1962 R&H Act.</p>
		<p>²⁶ The 12-foot channel in Sabine River from Orange to Echo, Texas deauthorized under Sec. 12 of PL 93-251. (1985 Deauthorization list)</p>
		<p>²⁷ Jetty extension was deauthorized under Sec. 1001 of PL 99-662.</p>
		<p>²⁸ Portion of project upstream of Brazoria/Galveston County line, approximately mile 18.5, in inactive category.</p>
		<p>²⁹ Cedar Bayou, miles 3 to 11 were deauthorized under Sec. 12 of PL 93-251 and were re-authorized under Sec. 349(a)(2), PL 106-541.</p>
		<p>³⁰ Channel to Port Bolivar turning basin was deauthorized under Sec. 1001 of PL 99-662.</p>

TABLE 40-C OTHER AUTHORIZED NAVIGATION PROJECTS

Project	For Last Full Report See Annual Report For	Cost to September 30, 2006	
		Construction	Operation and Maintenance
Aquatic Plant Control (1958 and 1962 River and Harbor Acts)	1967	38,252	–
Bastrop Bayou, TX ²	1931	9,920	27,129
Clear Creek and Clear Lake, TX	2004	66,934	549,599
Corpus Christi, TX, Channel to Navy Seaplane Base Encinal Peninsula	1968	1,194,344	26,467
Dickinson Bayou, TX	1954	33,942	57,553
Double Bayou, TX ⁶	2006	226,558	3,099,174
East Bay (Hanna Reef), TX ³	1922	2,476	847
Greens Bayou Bridges, TX	1993	450,000	–
Johnson Bayou, LA ⁴	1933	2,261	54,042
Little Bay, TX ⁵	1979	–	252,728
Oyster Creek, TX	1922	6,942	7,556

¹ Excludes \$1,672 work contribution.

² Widening from 60 feet to 100 feet at 4-foot depth was deauthorized under Sec. 12 of PL 93-251.

³ Inactive category for maintenance.

⁴ Channel adequate for existing commerce.

⁵ Aransas County Navigation District, Rockport, TX,

constructed project as authorized by 1950 River and Harbor Act (H. Doc. 114, 81st Cong., 1st Sess.) in 1955 under Department of Army permit.

⁶ Excludes contributed funds in the amount of \$233,325.

Vince and Little Vince Bayous, TX ²	1993	19,307,100	–

¹ Inactive.

² Completed.

³ In addition, \$8,695,438 expended from contributed funds, \$1,126,905 estimated value of contributed lands, and \$2,726,446 for relocations by local interests.

⁴ In addition, \$1,484,613 expended from contributed funds, estimated value of \$200,096 for contributed lands, and \$202,456 for relocations by local interests.

⁵ In addition, \$71,370 expended from contributed funds.

⁶ See Annual Report for 1983, Fort Worth District, page 16-12.

⁷ In addition, \$14,396,307 expended from contributed funds, estimated value of \$1,224,219 for contributed lands, and contributed work in the

amount of \$1,070,806 by local interests. Work performed at 100% Local Sponsor expense was in the amount of \$320,347.

⁸ In addition, \$237,792 expended from contributed funds.

⁹ In addition, \$92,920 expended from contributed funds.

¹⁰ In addition, \$480,888 expended from contributed funds.

¹¹ In addition, \$16,976,675 expended from contributed funds.

¹² In addition, \$12,340,997 expended from contributed funds.

¹³ Completed. Lower 8.6 miles of channel rectification on Highland Bayou was de-authorized April 5, 1999.

¹⁴ In addition, \$2,895,428 expended from contributed funds.

¹⁵ In addition, \$835,000 expended from contributed funds.

¹ Average.

² Includes 100-foot channel width.

³ Includes 450-foot channel to Corpus Christi.

⁴ Diameter.

⁵ Includes 350-foot channel width.

⁶ 300-foot width through Matagorda Peninsula.

⁷ Deauthorized.

⁸ Included in channel length.

⁹ Includes 300-foot channel width.

¹⁰ Channel dredged 34 feet deep by 250-200 feet wide by 9,908 feet long and basin 34 feet deep by 1,000 feet wide by 1,150 feet long by local interests.

¹¹ Not constructed.

¹² 9-foot by 150-foot channel completed from Houston Ship Channel to a point one mile below Anahuac, a distance of 23 miles. Upper end not connected to river channel to prevent salt intrusion into river. River channel maintained at 6 by 100-foot from mouth to Liberty, Texas.

¹ Includes the construction of a salt water barrier at Mile 16.9.
² Constructed 10 feet deep by 100 feet wide by local interests. East turnout channel constructed 150 feet wide.
³ Constructed by local interests.
⁴ Authorized to mile 13.2. Mile 8.2 to Mile 13.2 was deauthorized.
⁵ Authorized to Mile 31 above mouth (channel mile 29.41). Upper 3.4 miles was deauthorized under Section 12 of PL 93-251.
⁶ Includes a discharge channel from Matagorda, Texas, to the gulf, which was dredged by local interests in 1939. (Maintenance will be discontinued upon completion of improvements authorized by R&H Act of 1968.)

⁷ Authorized by R&H Act of 1968. Also provides for a dam across the present discharge channel, a new 250-foot wide by 20 to 23-feet deep discharge channel into Matagorda Bay, and a 15-foot by 200-foot wide entrance channel with parallel jetties from the gulf shoreline into the Gulf of Mexico. East jetty to be 3,500 feet long and west jetty 2,900 feet long.
⁸ Includes two protective breakwaters at entrance to turning basins.
⁹ In the inactive category for maintenance.
¹⁰ Also provides for two stone jetties at the gulf entrance about 1,000 feet apart. (North jetty constructed 2,300 feet long and south jetty constructed 2,270 feet long.)
¹¹ South turnout is 200 feet wide.
¹² Authorized to mile 31. Mile 25.8 to Mile 31 was deauthorized.

MISSISSIPPI RIVER COMMISSION*

The Mississippi River Commission (MRC) was created by an act of Congress on Jun. 28, 1879. The Flood Control Act of May 15, 1928, authorized the Flood Control, Mississippi River and Tributaries (MR&T) Project. The Commission consists of three officers of the Corps of Engineers, one from the former Coast and Geodetic Survey (presently the National Oceanic and Atmospheric Administration), and three civilians, two of whom must be civil engineers. All members are appointed by the President with the advice and consent of the Senate.

During the fiscal year, the members of the Mississippi River Commission were: BG Robert Crear, who assumed command as Commander, Mississippi Valley Division, and President Designee of the Mississippi River Commission, on Jun. 3, 2004, and was appointed as a member and President Oct. 6, 2006; Mr. Sam E. Angel, reappointed as member, Nov. 15, 1999; Mr. R. D. James, civil engineer, reappointed as member Apr. 16, 2003; Mr. William Clifford Smith, civil engineer, appointed Oct. 22, 1998; BG Bruce A. Berwick, Commander, Great Lakes and Ohio River Division, appointed as member Oct. 6, 2006; RADM Samuel P. De Bow, Jr., NOAA, appointed as member Oct. 6, 2006; BG Gregg F. Martin, Commander, Northwestern Division, appointed as member Oct. 6 2006; and COL Albert M. Bleakley, Jr., Secretary of the Commission (nonvoting position).

The MRC is charged, under direction of the Secretary of the Army and supervision of the Chief of Engineers, with prosecution of improvements for flood control of the Mississippi River and of its tributaries and outlets in its alluvial valley, so far as they are affected by Mississippi River backwater, between Head of Passes, LA (mile 0), and Cape Girardeau, MO (1,006 miles AHP-Lower Mississippi mileage terminates at mile 954 AHP), and with prosecution of improvements in the interest of navigation between Cairo, IL (954 miles AHP), and Baton Rouge, LA (234 miles AHP); and for stabilization of the lower 7 miles of the right bank of the Ohio River, to former mouth of Cache River. It also is charged with prosecution of certain flood control works on the Mississippi River and tributaries, as far as they are affected by backwater, between Cape Girardeau, MO, and Rock Island, IL (1,437 miles AHP), and with prosecution of

improvements on designated tributaries and outlets below Cape Girardeau for flood control, navigation, major drainage, and related water uses. Authorized operations of the Commission below Cape Girardeau are conducted by District Engineers of New Orleans, Vicksburg, Memphis, and St. Louis Districts within the areas described below, in accordance with approved directives and programs and congressional appropriations therefore.

The Mississippi River Commission continued its 128-year tradition of listening, inspecting, partnering, and engineering in the Mississippi Valley by conducting its 376th Session on Apr. 15-20, 2007, onboard the motor vessel *Mississippi* en route from Caruthersville, MO, to Baton Rouge, LA. Public hearings were held at Caruthersville; Memphis, TN; Natchez, MS; and Baton Rouge. More than 225 people attended these public meetings. On Sunday, Apr. 15, COL Charles Smithers III, District Engineer, Memphis District, briefed the members on the status of projects and critical issues within his area of operations. This was followed by a partnering session with local stakeholders. On Monday, Apr. 16, personnel from the Northwestern Division presented a briefing detailing local issues and listening session opportunities with regard to the planned Commission trip to the Missouri River Basin to coincide with the low-water inspection trip in August. In the evening, the members held a partnering session with local sponsors and stakeholders. On Tuesday, Apr. 17, BG Crear updated the members on the status of the coastal recovery mission in Louisiana and Mississippi resulting from hurricanes Katrina and Rita. On Wednesday, Apr. 18, COL Anthony Vesay, District Engineer, Vicksburg District, provided a project status update and overview of key issues within his District. That same day, the members were hosted by the city of Natchez as part of an inspection of city's the Section 592 project. This project is an ongoing effort to rehabilitate and modernize a 100-year-old system of massive, underground drainage culverts. On Thursday, Apr. 19, COL Richard Wagenaar, District Engineer, New Orleans District, provided the members with a project status update and an analysis of critical issues within his area of operations. RADM De Bow also briefed the members on the forecast for the upcoming 2007 hurricane season.

* Authorizing legislation (Tables 41-D and 41-E) is listed at the end of this chapter. All other tables are referenced in text and also appear at the end of the chapter.

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

From Aug. 11-16, the Mississippi River Commission conducted a listening and inspection tour of the Missouri River Basin. This trip represented a continuation of the Commission's desire to share experiences, information, and lessons learned from the watershed management practices of tributary basins as inaugurated by the Commission's 2005 listening and inspection tour of the Ohio River. On Sunday, Aug. 12, the members participated in a tribal powwow in Hays, MT, with tribal elders from the Assiniboine and Gros Ventre Tribes. In subsequent dialog, the members listened to the concerns of the tribal elders with respect to land and water rights, protection of cultural resources, infrastructure rehabilitation and modernization, and economic development opportunities. On Monday, Aug. 13, the members met with Governor Hoeven of North Dakota and various local stakeholders and discussed the impacts and realities of the ongoing 8-year drought in the region. The following day, Aug. 14, the members traveled to South Dakota and met with Governor Rounds and other state officials. The discussion again centered on the extreme drought conditions in the region and the application of the 1944 Flood Control Act., but other issues such as flood control, hydropower, recreation, and water supply also were discussed at length. The members conducted a site visit of the Oahe Dam to discuss water levels, sedimentation, endangered species, and other challenges. On Wednesday, Aug. 15, the members traveled to Kansas City, MO, and received an overview briefing on key issues at the confluence of the Missouri and Kansas Rivers. Key issues discussed involved bed degradation of the Missouri River, impacts to the water supply for over 1.2 million people at Kansas City and Johnson County, KA. The members also viewed the L-385 levee and experienced the great partnership between the local municipality, the local levee district, and the Corps of Engineers. Later that day, the members traveled to Jefferson City, MO, and met at the governor's mansion with the staff of several state agencies. On Thursday, Aug. 16, the members took a barge trip on the Missouri River and were able to discuss and inspect issues concerning the need for a reliable navigation channel for commercial traffic, examples of rock dike structures providing habitat for the endangered pallid sturgeon, the impacts of low water on hydropower generation and drinking water supplies, and the degradation of the river.

The 376th Session was held Aug. 17-24, 2007, onboard the motor vessel *Mississippi* en route from St. Louis, MO, to Morgan City, LA. Public hearings

were held at St. Louis; Cape Girardeau, MO; Memphis; Greenville, MS; and Morgan City. More than 500 people attended the meetings. During the course of the trip, the District Engineers from the St. Louis, Memphis, Vicksburg, and New Orleans Districts provided briefings on the status of projects and critical issues within their areas of operation. On Thursday, Aug. 16, the members received a briefing in St. Louis on the Navigation and Ecosystem Sustainability Program and the Upper Mississippi River Comprehensive Plan. On Tuesday, Aug. 21, the members visited the Mud Island River Park and participated in the dedication ceremony of a historic benchmark commemorating the long-standing partnership between the National Oceanic & Atmospheric Administration, the Corps of Engineers, and the Mississippi River Commission. On Wednesday, Aug. 22, the members hosted the International Commission for the Protection of the Danube River aboard the motor vessel *Mississippi*. The two commissions shared lessons learned and exchanged briefings on their respective projects and history.

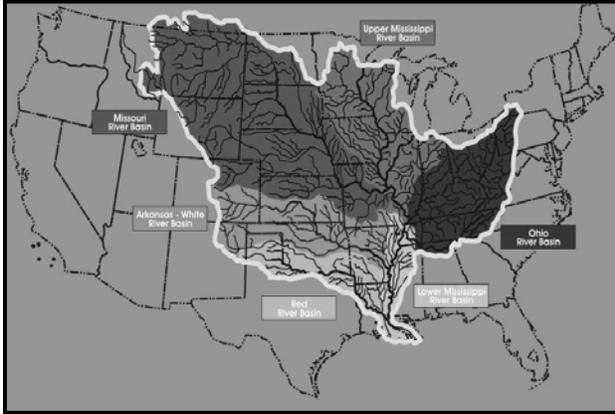

On Thursday, Aug. 23, the members received status briefings from Task Force Hope Director, Karen Durham-Aguilera, on the Louisiana Coastal Protection and Restoration and the Hurricane Protection system. Personnel from the New Orleans District also presented a briefing on the Louisianan Coastal Authority. Following the briefings, the members boarded the motor vessel *Teche*, a survey boat, and conducted a site inspection of the 35-foot channel study area in the Atchafalaya Basin. The members viewed firsthand examples of fluff and the delta building process and inspected maintenance issues of the low-water channel when it falls below the authorized 20-foot channel level.

During the fiscal year, the Mississippi River Commission listened to, inspected alongside, partnered, and evaluated engineering solutions with more than 1,000 stakeholders, state representatives, nongovernment organization representatives, and local interests.

The mission of the Mississippi River Commission includes balancing the requirements of flood control, navigation, and the environment by providing water resource engineering direction and policy advice to the Administration, Congress, and the Army in a drainage basin that comprises 41 percent of the United States and

MISSISSIPPI RIVER COMMISSION

2 provinces of Canada, and to lead sustainable management and development of water and related resources for the nation's benefit and the people's well-being.

The basin drains 41% of the US: - 31 States, 2 Canadian Provinces

The unique structure of the Mississippi River Commission continues to serve the nation well (military and civilian): the three engineer officers from the Army, one uniformed officer from NOAA, and three civilian members (two must be civil engineers).

- Since August 1997, the Mississippi River Commission has resumed its inspection of upper Mississippi River. In August 2005, the Commission conducted a listening and inspection tour of the Ohio River Basin and in August of 2007, did the same on the Missouri River Basin; both in an effort to share and learn from experiences from the watershed management of those tributary basins.
- Stakeholders and the public have requested Mississippi River Commission involvement in several major studies and projects.
- For projects and studies that require a broad watershed approach with multiple levels of interest, the Mississippi River Commission's authorities, resources, and relationships continue to prove effective.

The Mississippi River Commission provides:

- A valuable forum, voice, and partner for diverse interests throughout the basin.

- Implementation oversight for a range of water resource activities and comprehensive management of the Mississippi River & Tributaries Project.
- An established record of expertise and accomplishment.
- A clear charter that includes the entire watershed.
- An avenue to task U.S. Army Corps and NOAA for equipment and personnel.
- Working relationships with the Chief of Engineers, the Assistant Secretary of the Army for Civil Works, and Congress to address challenges and make improvements in the watershed.

The Records of Proceedings for all sessions of the Mississippi River Commission are on file in the office of the President at the Mississippi River Commission building in Vicksburg, MS.

New Orleans District: Mississippi River project levees and river channel stabilization as required from Head of Passes, mile 0 to 320 AHP, construction of three salinity-control structures for fish and wildlife enhancement, two in lower Mississippi River Delta region, and one in the Mississippi-Louisiana Estuarine Area; Bonnet Carré and Morganza Floodways; maintenance and improvements of Mississippi River navigation channel from Baton Rouge, LA (mile 234 AHP), to mile 320; Baton Rouge Harbor (Devils Swamp); navigation improvement of Atchafalaya and Old Rivers from Mississippi River to Morgan City; control of Old and Atchafalaya Rivers; Atchafalaya Basin Floodways; flood control and drainage improvements in Bayou Cocodrie and tributaries, in Bayou des Glaises, and in Upper Pointe Coupee Loop area; and freshwater distribution from Atchafalaya River to Teche-Vermilion Basins.

Vicksburg District: Mississippi River project levees and river channel stabilization as required from upper limits of New Orleans District (mile 320 AHP) in vicinity of Black Hawk, LA, to Coahoma-Bolivar County line, MS (mile 620 AHP) on left bank, and to vicinity of mouth of White River, AR (mile 599 AHP), on right bank including south bank Arkansas River levee to vicinity of Pine Bluff, AR, and north bank

levee to vicinity of Tucker on left bank of Plum Bayou, AR; bank stabilization in lower 36.1 miles of Arkansas River; maintenance and improvement of Mississippi River navigation channel between miles 320 and 599 AHP; Vicksburg and Greenville Harbors; specific fish and wildlife facilities in Tensas, Yazoo, and Big Sunflower Basins; a demonstration erosion control project in the Yazoo Basin; flood control and drainage improvements in Red River backwater area including leveed portions east and west of Black River and south of Red River; Jonesville, LA, Boeuf and Tensas Rivers, Bayou Macon Basins and tributaries, AR and LA, and Bayou Lafourche, LA; Yazoo River Basin, MS, including backwater area; Big and Little Sunflower Rivers, Deer Creek, and Steele Bayou, MS; and Grand Prairie Region and Bayou Meto Basin, AR, including provision for agricultural water supply.

Memphis District: Mississippi River project levees and river channel stabilization as required, from upper limits of Vicksburg District to north bank of Little River diversion channel, MO (1,003 miles AHP), a few miles below Cape Girardeau, MO, on right bank, and to Cache River diversion channel (967 miles AHP) above Cairo, IL, on left bank, including levees and revetment on right bank of Ohio River, in Mounds-Mound City area, IL; except operations above Cairo, IL, do not include channel stabilization on the Mississippi River. Maintenance and improvement of Mississippi River navigation channel between mile 599 and 954 AHP and of Memphis Harbor, TN; specific fish and wildlife facilities in St. Francis Basin; levees in White River backwater area up to vicinity of Augusta, AR, and a pumping plant near mouth of White River; levees and pumping plants at De Valls Bluff and Des Arc, AR; channel improvements in Cache River Basin, AR; channel improvements in Big Creek and tributaries, AR; improvement works in St. Francis River Basin, MO and AR, including backwater area improvements in Belle Fountain Ditch and Drainage District No. 17, AR; Castor River diversion channel, MO, and L'Anguille River, AR; Wolf River Basin, TN; Obion and Forked Deer River Basins, TN; Reelfoot Lake area, including channel improvement for Bayou du Chien and Lake No. 9, TN and KY; West Kentucky tributaries, KY; Mud Lake pumping station, TN; and pumping plants and outlet structures in the Cairo-Mounds-Mound City area, IL. Channel improvements to Francis Bland Floodway Ditch (Eight Mile Creek), Arkansas; Whiteman's Creek Ten Mile and Fifteen Mile Bayous in West Memphis, and vicinity Arkansas; Horn Lake Creek and Tributaries,

Mississippi; and Nonconnah Creek, Tennessee and Mississippi. Navigation channel and harbor improvements to Helena Harbor and vicinity, Arkansas at Mississippi River, mile 652 AHP. Channel improvements and pumping station for Helena, Phillips County, and vicinity, Arkansas and St. Johns Bayou and New Madrid Floodway, Missouri.

Field operations of the commission restricted to levee construction under Sec. 6, 1928 Flood Control Act (local interests contributing one-third of costs and furnishing rights-of-way) are conducted within the following limits by two districts reporting directly to the Commission on matters within their jurisdiction—St. Louis District: Mississippi River (Sec. 6) levees from upper limits of Memphis District to Clemens Station, MO (1,254 miles AHP), on right bank, and Hamburg Bay, IL (1,215 miles AHP), on left bank, and Illinois River from its mouth to mile 120 at Havana, IL. Rock Island District: Mississippi River (Sec. 6) levees from upper limits of St. Louis District to Rock Island, IL (1,437 miles AHP). For work accomplished see Table 42-N, page 42-50, Annual Report for 1975.

St. Louis District: Wappapello Dam and Lake is located on the upper St. Francis River in Sections 2 and 3, Township 26 North, Range 7 East, Wayne County, Missouri. The dam is located at river mile 213.2; 16 miles northeast of Poplar Bluff, Missouri; less than 1 mile southwest of Wappapello, Missouri. This dam and reservoir project provides flood control, recreation, water quality, and conservation of fish and wildlife. Wappapello Lake consists of 44,349 acres of land and 8,400 acres of water.

MISSISSIPPI RIVER AND ALLUVIAL VALLEY BELOW CAPE GIRARDEAU, MO

Location and description. The Mississippi River rises in Lake Itasca, MN, and flows generally southerly for 2,340 miles through the central portion of United States to empty into the Gulf of Mexico 115 miles below New Orleans. It is improved for barge navigation for 1,832 miles to Minneapolis, MN. The Mississippi River and its major tributaries, the Missouri, Ohio, St. Francis, White, Arkansas, Yazoo, and Red-Old Rivers, drain 1,245,000 square miles in all or part of 31 states between the Rocky and Appalachian Mountains and part of two Canadian provinces. Below Cape Girardeau, MO, 53 miles above Ohio River, river bottomlands widen abruptly into an alluvial valley of 35,460 square miles which was originally subjected to flood overflow.

MISSISSIPPI RIVER COMMISSION

A major part of the alluvial valley has been protected from floods by levees which confine floodflows within a floodplain having an average width of 5 miles. (See map of alluvial valley of Mississippi River, scale 1:500,000.) Observations made by Mississippi River Commission to Sep. 30, 1982, show approximate all-time maximum and minimum discharges between levees as follows: Cairo to White River, 2,000,000 and 70,000 cubic feet per second; thence to Red River, 2,150,000 and 90,000 cubic feet per second; thence to the Gulf of Mexico, 1,500,000 and 50,000 cubic feet per second in Mississippi River and 660,000 and 11,000 cubic feet per second in Atchafalaya River. As the 1927 floodflow was not con-fined between levees, maximum discharges recorded do not include entire flow of the 1927 flood, maximum of record below White River. High water and flood stages usually occur in late winter or early spring, but great floods such as that of 1937 occurred as early as January. Low water stages generally prevail from August to December. Extreme all-time high in stages recorded at representative gages (rounded to nearest foot) are 60 feet at Cairo, 49 feet at Memphis, 61 feet at Red River Landing, and 21 feet at New Orleans (Carrollton). The river is nontidal above Red River Landing where tidal amplitude rarely exceeds 0.1 foot during extreme low water.

Previous projects. For details see page 1944, Annual Report for 1932.

Existing project. The Mississippi River and Tributaries Project in the alluvial valley between Head of Passes, LA, and Cape Girardeau, MO, provides protection from floods by means of levees, floodwalls, floodways, reservoirs (in Yazoo and St. Francis Basins), bank stabilization, and channel improvements in and along the river and its tributaries and outlets insofar as affected by backwater of Mississippi River, including levee work on the main stem between Cape Girardeau and Rock Island. When completed, 23,621 square miles will be protected from the Mississippi River project flood. The project also provides for a 12- by 300-foot navigation channel between Baton Rouge, LA, and Cairo, IL; for salinity-control structures; and for channel realignment and improvement including bank stabilization and dikes to reduce flood heights, control natural tendency of river to lengthen by meandering, and protect levees from being destroyed by caving banks. Locations of major main stem Mississippi River improvements are shown in Table 41-A and those for off-main stem tributaries are shown in Table 41-B. Pertinent data on dams and lakes are shown in

Table 41-C. Authorizing and incorporating legislation are shown in Tables 41-D and 41-E. Summary of presently estimated Federal cost of authorized improvements is shown in Table 41-F. Construction of the existing project began in 1928 and has continued throughout ensuing years. Through Sep. 30, 2007, physical completion of the entire project is 88 percent.

Recommended modifications. None.

Local cooperation. The Flood Control Act of 1928, as amended, applies. Such requirements have, in general, been complied with by local interests.

Terminal facilities. See Port Series No. 21, 1990, for Ports of Baton Rouge and Lake Charles, LA; Port Series No. 20, 1990, for Port of New Orleans, LA; also folio of Flood Control and Navigation Maps of Mississippi River from Cairo, IL, to the Gulf of Mexico (59th edition), 1992.

Project cost. Total allotted for flood control, excluding maintenance charges through Aug. 18, 1941, chargeable under authorizations to Sep. 30, 2007, was \$8,300,195,182 (See Table 41-V.) (See also Tables 41-U, 41-W, and 41-X for additional financial statements.)

Alluvial Valley Mapping

General. Contoured quadrangles and general maps of the alluvial valley are available for departmental use and public distribution under prescribed regulations. Preparation, revision, and publication of quadrangle maps (scale 1:62,500) continued. Roadmap-type information brochures of principal portions of the overall project were published along with pamphlets on the subject of flood control and navigation. Maps and supplemental data sheets for active works were updated and published as required.

Work accomplished in the Districts:

New Orleans District— Supplemental funds were used in FY 07 for the conversion of the following twenty (20) 1:62,500 scale quadrangle maps from manual to digital form: Arnaudville, Baton Rouge, Carencro, Denham Springs, Fordoche, Grosse Tete, Loreauville, Maringouin, New Roads, St. Martinville, Zachary, Jeanerette, Hahnville, Opelousas, Palmetto, St. Francisville, Batchelor, Odenburg, Artonish, and Lake Felicity.

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

Memphis District—There were no revisions to 1:62,500 scale quadrangle maps in FY 07. There were 5,937 square miles of half-meter pixel, 1:12000 scale digital color orthophotography flown in FY 07.

Vicksburg District—There were no revisions to 1:62,500 scale quadrangle maps in FY 06. There was no color or black and white aerial photography flown in FY 07.

Floods

Streamflow observations during the fiscal year follow:

Memphis District—Mississippi River crest stage of 37.5 feet at Cairo gage on January 16, 2007, and maximum discharge of 874,000 cubic feet per second occurred at Hickman, KY, on January 16, 2007; a crest stage of 5.9 feet at Memphis on January 21, 2007, and a maximum discharge of 970,000 cubic feet per second at Memphis on January 21, 2007.

Vicksburg District—The Mississippi River in the Vicksburg District – Peak stages and discharges on the Vicksburg District’s reach of the Mississippi River were as follows: Arkansas City, 30.3 feet on Jan. 27, 2007, and maximum discharge of 1,175,000 cubic feet per second; Vicksburg, 37.8 feet on Jan. 27, 2007, and a maximum discharge of 1,180,000 cubic feet per second; and Natchez, 45.5 feet on Jan 27, 2007, and maximum discharge of 1,160,000 cubic feet per second.

New Orleans District—On the Mississippi River, the Red River Landing gage recorded a maximum stage of 48.6 feet NGVD on January 29, 2007, and the New Orleans gage recorded a maximum stage of 12.9 feet NGVD on February 1, 2007. On the Atchafalaya River, the Simmesport gage recorded a maximum stage of 32.6 feet NGVD on January 25, 2007.

Studies and Investigations

General investigations. Surveys and reports, authorized by laws and by Senate and House committee resolutions, were made as required and are discussed below. Collection and study of basic data continued.

A July 1997 resolution of the Committee on Transportation and Infrastructure of the U.S. House of Representatives authorized a study of flooding and other

problems in the area west of the Atchafalaya Basin Floodway between Alexandria, Louisiana, and the Gulf of Mexico. A reconnaissance study was initiated in FY 1998 and completed in FY 1999. See the FY 06 Annual Report for prior year details. In FY 07, project activities consisted of LIDAR and field surveys; hydrologic modeling for existing conditions base; economic analysis; environmental investigations; and the Value Engineering Report.

A May 1998 resolution of the Committee on Transportation and Infrastructure of the U.S. House of Representatives authorized a study of flooding and other problems in the area between Bayou Lafourche and the Mississippi River from Donaldsonville, Louisiana, to the Gulf of Mexico. A reconnaissance study was completed in FY 00. Feasibility study was initiated in FY 02, and continues in FY 06. FY 06 supplemental funds in the amount of \$490,000 were received.

An April 1992 resolution of the Public Works and Transportation of the U.S. House of Representatives Committee authorized a study of flooding and other problems east of the Atchafalaya Basin Floodway between Morganza, Louisiana, and the Gulf of Mexico. A feasibility study was completed in FY 2002 recommending a Federal project. The Chief of Engineers letter was signed in August 2002 and supplemental in July 2003 adding work-in-kind. The Energy and Water Development Appropriation Act of 1995 and the Water Resources Development Act of 1996 directed an expedited study of a lock in the Houma Navigation Canal under the authority of the Morganza, Louisiana, and the Gulf of Mexico study. An interim feasibility study on the lock was completed in FY 1997 and was approved for preconstruction engineering and design in FY 2000. In FY 2004 the Energy and Water Development Appropriations Act authorized a portion of the project, Reach I, Segment 1. The local sponsor has awarded three contracts of this feature as work-in-kind services. FY 06 supplemental funds in the amount of \$7 million were received and are being used to advance PED work.

A June 1998 resolution of the Committee on Environment and Public Works of the U.S. Senate authorized a study of the multipurpose flood control and agricultural water supply problems in the Boeuf-Tensas Basin of southeast Arkansas. A feasibility study was initiated in FY 2000 and is continuing.

MISSISSIPPI RIVER COMMISSION

A June 1973 resolution of the Committee on Public Works, U.S. Senate, authorized a study to identify appropriate implementable measures to address flood control, water quality, and environmental needs throughout the Coldwater River Basin below Arkabutla Lake, MS. The feasibility study is continuing.

The Spring Bayou Area, LA, environmental restoration study includes an evaluation of improvements to partially restore/enhance ecosystem functions. The Feasibility Cost-Sharing Agreement was signed 25 May 2006. Feasibility studies have been initiated and are continuing.

A March 1996 Resolution U.S. House of Representatives Committee on Transportation and Infrastructure authorized a study, Memphis Metropolitan Area Storm Water Management, TN MS. The study area includes all or parts of five counties: Fayette, Shelby, and Tipton in Tennessee; DeSoto and Marshall in Mississippi. The area encompasses all or parts of six major drainage basins, covering approximately 2,600 square miles. The purpose of the study is to evaluate the need for improvements for flood control, ecosystem restoration, water quality, and related purposes associated with storm water runoff and watershed management in the area. The reconnaissance study was initiated in FY 2006. FY 2006 funds were used to initiate the study by reviewing existing hydrologic and hydraulic data for three drainage areas, Grays Creek, Marys Creek and Beaver Creek, and to determine any additional problems and opportunities within the study area.

A March 1996 Resolution U.S. House of Representatives Committee on Transportation and Infrastructure authorized a study of flooding and other problems in the area of Millington and Vicinity, TN. The study area encompasses the Big Creek drainage basin, an area of approximately 154 square miles. Although this study area was included in the Memphis Metro Reconnaissance study, a supplemental reconnaissance report was completed and approved in December 2002 as a basis for negotiating the Project Management Plan (PMP) and a Feasibility Cost Sharing Agreement (FCSA). The FCSA with Shelby County, TN and the Chickasaw Basin Authority was executed in September 2003. The feasibility study was initiated in January 2004 and possible solutions to the problems were investigated as well as possible opportunities for

ecosystem restoration and development of recreation features. This study is scheduled for completion in FY 2008.

Mississippi River and Tributaries Levees

Operations and results during fiscal year. This feature consists of construction of new, and enlargement of existing, levees to approved grade and section; construction and restoration of levee berms; and construction, repair, and maintenance of roads on levees. Work accomplished is summarized in Table 41-N and further broken down as follows:

New Orleans District—Continued construction of levees in the Main Stem System. See Table 41-K. Supplemental funds for maintenance were received in the amount of \$81 million to perform emergency restoration and repair of the Mississippi River levee after Hurricane Katrina.

Vicksburg District—Continued construction of levees in the Main Stem System. See Table 41-L.

Memphis District—Continued construction of levees in the Main Stem System. See Table 41-M.

Condition as of Sep. 30. (See Tables 41-K, 41-L, 41-M, and 41-N.) There are 1,609.8 miles of levees authorized for the Mississippi River below Cape Girardeau, of which 1,603.0 miles are in place with 1,408.0 miles built to approved grade and section. The Main Stem Levee System consists of 2,215.7 miles, of which 2,208.9 miles are in place with 1,980.7 miles completed to approved grade and section. Included in this system are 85.4 miles of levees and structures along the south bank of Arkansas River miles (all completed); 59.2 along the south bank of Red River (all completed); and 449.2 miles in the Atchafalaya River Basin, with 449.2 miles in place and 416.0 miles completed to grade and section (see Table 41-N). Of the authorized 677.8 miles of berms and seepage control measures, 564.0 are complete. Graveled or hard-surfaced roads have been constructed on 2,094.8 miles of these levees.

There are an additional 1,511.0 miles of authorized tributary levees in the MR&T Project, of which 1,277.3 miles, are in place with 1,085.7 to approved grade and section. Berms have been completed on 15.3 miles and 970.1 miles of graveled or hard-surfaced roads have been constructed on the levees.

For summary of levee work see Table 41-N.

Mississippi River and Tributaries—Channel Improvements

Operations and results during fiscal year. Dredging: Mississippi River Main Stem — (See Table 41-G.) Work included dredging 9,953.8 cubic yards for maintenance of channel and harbor improvements. Minimum channel depth of 9 feet was maintained. Dredging was done with the following plant: Vicksburg District, channel maintenance was performed by government-owned dredge *Jadwin*. Memphis District channel maintenance dredging was performed by the Government-owned dustpan dredge *Hurley* and leased dustpan dredge *Pontchartrain*.

The MR&T Harbors maintained in Memphis District were Helena Harbor, Phillips County, AR, and Memphis Harbor (McKellar Lake), by leased cutter-head dredge *Pontchartrain*. MR&T Harbors maintained in Vicksburg District were Greenville Harbor and Vicksburg Harbor by USACE dustpan dredge *Jadwin*.

Bank revetment and dikes: (See Table 41-H, 41-I, and 41-J.) Construction of 1.89 miles of new bank revetment and 122,720 squares of concrete mattress, for maintenance, along the Mississippi River was completed by Government plant and hired labor. Also, 4.33 miles of new dikes were constructed and required maintenance was performed.

Construction of 0.35 mile of new bank revetment and 30,713 squares of concrete mattress for maintenance were completed on the Atchafalaya River.

Other work performed in the interest of navigation, supplementing maintenance dredging on Mississippi River between Cairo, IL, and Baton Rouge, LA, included removal of snags, wrecks, and obstructions; issuance of bulletins by the Vicksburg District providing information on available high-water velocities at selected locations; maintenance of bulletin boards showing daily gage readings at regular MRC gages; and contact pilot service furnishing navigation interests with latest information and advice on channel conditions and navigation interests. Cost of this work is given in Table 41-U.

Condition as of Sep. 30. In carrying out authorized channel improvement program between Baton Rouge and Cairo, 16 cutoffs were developed between 1933 and 1942. These, combined with chute channel development and alignment improvements, decreased channel length between these cities by about 170 miles. However, current velocities increased the attack on the banks and the river began to regain its length. As a result, the net shortening between 1933 and 1962 was 114 miles of the theoretical 170-mile cutoff.

There are now in place 1,046.64 miles of operative bank revetment and 319.92 miles of dikes on the lower Mississippi River. This amount of channel stabilization should prevent the river from regaining much more of its length due to meandering. A navigation channel 9 by 300 feet is being accomplished by revetment and dikes and maintained by dredging as required during the low-water season. Due to growing effectiveness of channel improvement program, average maintenance dredging requirements are steadily being reduced, and an increase in navigable depth is being obtained. Approximately 143.4 miles of foreshore protection have been constructed along the lower Mississippi River.

There are 88.99 miles of revetment and 5.9 miles of dikes on tributary channels as listed in Tables 41-H, 41-I, and 41-J.

New Orleans District

ATCHAFALAYA BASIN, LA

Operations and results during fiscal year. New work by hired labor: Real estate activities and planning for construction were continued.

Construction of levee enlargements and floodwalls continued on the east and west protection levees, and levees west of Berwick.

In FY 06, two contracts were completed for levee enlargements at E33 on the East Atchafalaya Basin Protection Levee and W124 Gap Closure in the vicinity of Berwick, as well as the contract for discharge lines at the Gordy Pumping Station. Three contracts with a total value of \$14.5 million were awarded in FY 07:

MISSISSIPPI RIVER COMMISSION

W86 Phase 1 and W102 on the West Atchafalaya Basin Protection Levee and West Bayou Sale Gordy Phase A in the area west of Berwick. In FY 08, three contracts will be awarded at E54/E58, W74, and West Bayou Sale North Bend Phase 1.

Maintenance by hired labor: Operation and maintenance of Bayou Boeuf, Berwick and Bayou Sorrel Locks, the Morganza, Charenton and East & West Calumet Control Structures, condition and operational studies, and the water control management activities were continued. Levee gap repairs to the flood protection levees within St. Mary Parish were completed. The St. Mary Parish Government cut gaps in the levees to drain floodwaters after the passing of Hurricane Rita.

Maintenance by contract (stone placement): To protect the East Atchafalaya Basin flood protection levee from erosion, stone was placed along the bank just below Bayou Sorrel Lock. Also, to protect riverine levees, stone hardpoints at Atchafalaya Station and Butte Larose were established.

Berwick Harbor was dredged during the spring and fall. Three Rivers and Baton Rouge Harbor were dredged during the fall and summer.

Condition as of Sep. 30. Construction was initiated Aug. 7, 1929, with commencement of the west protection levee from Bordelonville to Hamburg, LA. The project is 95 percent complete. The current estimated Federal cost is \$1,798,000,000 and non-Federal cost is \$11,000,000. Of the 449.2 miles of levees and floodwalls authorized for the Atchafalaya system, 416.0 miles are built to grade. See Table 41-K for status of levees.

Construction of the first 2.5 miles of the proposed 5 miles of channel was initiated in January 1958 and completed in July 1959, with 7,458,086 cubic yards excavated.

The remaining 2.5 miles were to be constructed when development of the initially constructed portion warrants expansion. Project expansion has not been necessary. Therefore, this feature was deauthorized on Nov. 2, 1979, under the provisions of Section 12, Public Law 93-251 (WRDA 74), as amended.

Major items remaining to be completed include completion of levees to grade and section, modification of existing structures, and construction of two freshwater distribution structures. Approximately 57.6 miles of bank stabilization have been placed as shown in Table 41-H.

Flood Control

ATCHAFALAYA BASIN FLOODWAY SYSTEM, LA

Location. The project lies in the lower part of the Atchafalaya Basin which is situated in south-central Louisiana. It lies in parts of Iberville, Iberia, Point Coupee, St. Martin, St. Mary and St. Landry Parishes. Further, it is limited to the part of the Atchafalaya River Basin that has been confined between protection or guide levees that are about 15 miles apart. The northern boundary, west of the Atchafalaya River, lies along the south right-of-way line for the Union Pacific Railroad near the south side of U.S. Highway 190 between the West Atchafalaya Basin Protection Levee (WABPL) and the west limits of the Town of Krotz Springs, thence southerly along the west limits of the town and easterly along the south limits of the town to the Atchafalaya River; east of the Atchafalaya River it lies along the southern right-of-way line for the Union Pacific Railroad. The eastern and western boundaries lie at the floodside toes of the East Atchafalaya Basin Protection Levee (EABPL) and WABPL, respectively. The area within these limits has been calculated at about 595,000 acres.

Existing project. This project was authorized by the Supplemental Appropriations Act of 1985, Public Law 99-88. The project was reauthorized and amended by Section 601 of the Water Resources Development Act of 1986, Public Law 99-662 (hereafter WRDA 1986). The Corps of Engineers, New Orleans District, completed a comprehensive feasibility study report for the ABFS in January 1982 that recommended implementation for three separable elements including land acquisition, recreation, and water management units. Funding for the acquisition of the real estate feature made available by the Energy and Water Appropriations Bill of 1988, Public Law 100-202.

To date approximately 116,802 acres in developmental control and environmental easements have been

acquired, leaving a balance of approximately 230,000 acres to acquire. Acquired 47,084 acres in fee, excluding minerals, from willing sellers. The recreational portion of the ABFS is cost-shared 50/50 between the Corps and the local sponsor and OMR&R is 100% non-federal. The recreation portion includes boat landings, canoe trails, 3-state type park facilities, project visitor center, primitive campgrounds, etc. Through FY 06, detailed design has been completed and a PCA has been executed for the Myette Point Boat Landing. Preliminary planning has been initiated for Bayou Sorrel, Krotz Springs, and Butte LaRose boat landings. Construction has been completed for the Simmesport Boat Landing. Local support exists for a regional visitor center in Morgan City, LA. Construction began in FY 06 and will continue in FY 07 on the Buffalo Cove Pilot Water Management Unit. The Supplemental Environmental Impact Statement for Henderson Water Management Unit, which includes the ABFS Recreation Feature, was initiated in FY 06.

Operations and results during fiscal year.

Continued operations of previously acquired easement and fee lands including easement inspections, outreach, natural resource management and consumptive and non-consumptive public access programs were conducted throughout the year.

Local cooperation. Various Design Agreements and PCA's will be required between the Corps and the non-federal sponsor for project implementation. To date a PCA has been executed between the Federal Government and the State of Louisiana Department of Natural Resources for the construction and OMR&R of the Buffalo Cove project, as well as PCA's between the Government and Avoyelles Parish Police Jury and St. Mary Parish Government for Simmesport and Myette Point boat landings, respectively. In addition, several design agreements have been executed between the Government and local parishes for recreation planning.

Condition as of Sep 30. Total Project cost is \$466,182,000 with an estimated Federal cost of \$387,366,000 and a non-Federal cost of \$78,186,000. Through FY 07, \$125,273,000 has been expended.

Water management unit (WMU) construction (Buffalo Cove) was initiated in FY 06 and is anticipated to be complete in FY 08. An SEIS, inclusive of recreation, is underway for all 5 approved WMU's within the ABFS project area. Recreation features are being advanced as described above.

Public access efforts were suspended pending WRDA legislation that would resolve the cap on expenditures (\$32M) and/or acreage (50,000). Efforts were made in FY 05 to clarify language associated with the acquisition easement in cooperation with USFWS.

BAYOU COCODRIE AND TRIBUTARIES, LA

Operations and results during fiscal year. Maintenance by hired labor consisted of water control management.

Condition as of Sep. 30. Construction was initiated in June 1946 and is 57 percent complete, based on the current estimated Federal cost of \$20,400,000 and non-Federal cost of \$323,000. See page 2031, Annual Report for 1961, for description of completed work.

Work required to complete the project consists of enlargement of 13.5 miles of upper Bayou Boeuf, channel improvement of 25.3 miles of Bayou Cocodrie, enlargement of Bayou Courtableau from Washington, LA, to the west protection levee, and additional culverts through the west protection levee at 100 percent Federal cost in lieu of the previously authorized diversion channel from Washington to the Bayou Courtableau drainage structure.

With the termination of the Eastern Rapides and South Central Avoyelles project, it has become necessary to provide an adequate outlet structure solely for the Bayou Cocodrie and Tributaries project. The economic effects of this change along with current benefits estimates have caused the benefit-cost ratio for the project to be less than unity. As a result, the project has now been classified as inactive. If economic conditions change, the project could be reactivated.

MISSISSIPPI RIVER COMMISSION

BONNET CARRÉ SPILLWAY, LA

Operations and results during fiscal year. Maintenance by hired labor: Condition and operation studies, water control management, and ordinary maintenance of the control structure and spillway continued.

Condition as of Sep. 30. Construction of the spillway was initiated in FY 1929. The control structure was completed in 1931, levees were completed in 1932, and utility crossings were completed in 1936. The cost of the completed work is \$14,212,200.

It was necessary to operate the structure to reduce flood stages in 1937, 1945, 1950, 1973, 1975, 1979, 1983 and 1997. The structure was operated in 1994 to transfer fresh water from the Mississippi River to Lake Pontchartrain. The structure was operated for one month from March 17-April 17, 1997, to reduce flood stages.

Needle replacement began in FY 96 with the purchase of about 625 needles for \$80,000. The total replacement quantity required is approximately 7,000. An additional cable security system has been installed through needle eyes to prevent needles from dislodging during severe storms.

Restoration of the east guide levee from U.S. Hwy 61 to Lake Pontchartrain was completed in 2005.

Natural Resources and Recreation Project Master Plan was approved and implemented in 1998. Operational Management Plan is under development. A staff of three Park Rangers is now stationed at the spillway to implement the recreation and natural resource programs.

OLD RIVER, LA

Operations and results during fiscal year. Maintenance by hired labor consisted of operation and maintenance of the lock and control structures as required, condition and operation studies, water control management, maintenance of cleared areas, levee shaping, and engineering studies.

Natural Resources and Recreation Master Plan was completed. Operations and maintenance activity includes development of Old River Cooperative Visitor Center.

In FY 07, completed contracts include dredge Old River Lock forebay channel, modify emergency stoplog machinery, build new equipment shed, repair emergency stoplogs and repair canal floating guidewall at Old River Lock, and build new equipment shed at Lowsill structure. Continued contract to install PLC system at Old River Lock. Awarded contracts to fabricate spare parts for Old River Lock miter gates, develop detailed cost estimate for rerouting Highway 15, and repair fracture critical welds on emergency bulkheads for Old River Auxiliary Control Structure.

Condition as of Sep. 30. Construction began September 1955 and is complete at a Federal cost of \$292,273,000. Principal items completed are as follows: Low-sill structure, June 1959; overbank structure, October 1959; auxiliary structure, September 1986; levees and levee enlargements, October 1963; inflow and outflow channels for the Lowsill structure, February 1961; inflow and outflow channels for the auxiliary structure, August 1987; navigation lock completed December 1962 and opened to navigation March 1963, at which time Old River was closed to navigation with a rock and earthfill dam; and highway approaches and bridge over the lock completed March 1965. Approximately 9.4 miles of bank protection have been constructed at the inflow and outflow channels. (See Table 41-H for details of bank protection.)

LOUISIANA STATE PENITENTIARY LEVEE, LOUISIANA

Location. The project is located near Angola, LA, in West Feliciana Parish, approximately 40 miles northwest of Baton Rouge, LA, and borders the Louisiana State Penitentiary along the Mississippi River and State of Mississippi state line.

Existing project. The project consisted of improving about 12 miles of levees along the Mississippi River

which afford flood protection to the penitentiary on the left descending bank below Old River. The levees were owned and maintained by the State of Louisiana and are substandard with regard to Federal specifications. By improving the existing levees to Federal standards, the project will reduce the risk of flooding with its attendant property damage and threat to the lives of up to 5,100 inmates and about 1,750 employees and residents (527 reside on the penitentiary grounds). Funds to initiate preconstruction, engineering and design were appropriated in FY 97 and funds to initiate construction were appropriated in FY 98.

Local cooperation. The limited Reevaluation Report was approved on July 2, 1999 and formed the basis for execution of the Project Cooperation Agreement which was approved on July 30, 1999. The local Sponsor, the Louisiana Department of Public Safety and Corrections has provided cash in the amount of \$5,171,000 in addition to furnishing the lands and damages (including mitigation lands) necessary to support their share of the project cost.

Conditions as of Sep. 30. The project was physically completed in FY 03 and was completed in July 2003. The total estimated cost is \$25.0 million (\$18.8 million Federal, \$6.2 million non-Federal). Construction was initiated in Sep. 1999. Two contracts were for the levee upstream of Camp C and the other was for replacement of the existing drainage structure. All three contracts were completed in FY 01. The final contract to enlarge the levee from Camp C to the main gate was awarded in Apr. 2001.

Salinity Control Structures

MISSISSIPPI DELTA REGION, LA

CAERNARVON FRESHWATER DIVERSION STRUCTURE, BRAITHWATE, LA

Location. The Caernarvon structure is constructed in the Mississippi River Levee on the left descending bank at mile 81 AHP, just below the St. Bernard-Plaquemines Parish line.

Existing project. The Caernarvon Freshwater Diversion Feature of the Miss. Delta Region Project is capable of diverting up to 8,000 cfs of River water into

the Breton Sound Estuary for fish and wildlife habitat enhancement. River stages and the fresh water needs of the estuary, determined by monitoring data, establish the actual quantities to be diverted.

Local cooperation. The Local Cooperation Agreement with the State of Louisiana was signed in June 1987. Cost sharing for initial construction and ongoing operations and maintenance is 75% Federal and 25% non-Federal. The project is operated and maintained by Plaquemines Parish, under the direction of the LA Department of Natural Resources.

Condition as of Sep. 30. Construction began in 1988 and was completed in 1991, at a Federal cost of \$17,550,051 and a non-Federal cost of \$5,850,017. Diversions have been ongoing, as needed, since August 1991. The goal of fish and wildlife habitat improvement has been met or exceeded, most notably in the areas of seed oyster availability on the public oyster grounds, a large variety and volume of recreational fishing and duck hunting.

DAVIS POND FRESHWATER DIVERSION STRUCTURE, LA

Location. The Davis Pond structure is constructed in the Mississippi River Levee on the right descending bank at mile 118 AHP, in St. Charles Parish, two miles Luling, LA.

Existing project. The Davis Pond Freshwater Diversion Feature of the Miss. Delta Region Project will be capable of diverting up to 10,650 cfs of River water into the Barataria Bay Estuary for fish and wildlife habitat enhancement. Fresh water needs of the estuary, determined by monitoring data, will establish the actual quantities diverted.

Local cooperation. The Project Cooperation Agreement was signed in April 1993 with the State of Louisiana. Cost sharing for initial construction and ongoing operations and maintenance is 75% Federal and 25% non-Federal. The project will be operated and maintained by St. Charles Parish, under the direction of the LA Department of Natural Resources.

Condition as of Sep. 30. Construction began in 1996 and was substantially completed in 2002, at an estimated Federal Cost of \$98,700,000 and a non-Federal cost of \$32,900,000 for the Construction Phase of

MISSISSIPPI RIVER COMMISSION

this Feature. Diversions have been ongoing, as needed, since August 2002. Final second lift levee construction was completed in 2007. Ongoing monitoring under the construction phase of this feature will continue into 2009. Additional modifications to the outfall will be completed in 2009.

Vicksburg District

LOWER ARKANSAS BASIN, AR

Condition as of Sep. 30. Arkansas River levees. A total of 56.2 miles of the 61.5 miles of north bank levees and all of the 85.4 miles of south bank levees have been completed to approved grade and section. These levees above mile 36.1 are protected by bank-protection works constructed as a feature of project for Arkansas River and Tributaries, AR and OK. For present status of this work, see report of Little Rock District. Below mile 36.1, needed bank protection is constructed with project maintenance funds. Little Bayou Meto gates and lifting mechanism were replaced during FY 88. Big Bayou Meto Gate operating mechanisms replaced FY 94, 95, 96.

LOWER RED RIVER SOUTH BANK RED RIVER LEVEES, LA

Operations and results during fiscal year. Maintenance by hired labor consisted of water control management..

Condition as of Sep. 30. All of the 59.2 miles of levees authorized are completed to approved grade and section.

TENSAS BASIN, AR AND LA

(a) **Boeuf and Tensas Rivers, and Bayou Macon, AR and LA.**

Operations and results during fiscal year. Planning and design on project features are complete. The Lake Chicot Pumping Plant and related features are complete and in operation.

Condition as of Sep. 30. Lake Chicot Pumping Plant crane was repaired and the bell housing was replaced.

(b) **Red River backwater area.**

Operations and results during fiscal year. Routine operation and maintenance was performed on the Tensas-Cocodrie Pumping Plant along with construction of mile 0.2 setback.

Condition as of Sep. 30. A contract for bank stabilization will be awarded when funds are made available.

YAZOO BASIN, MS

Operations and results during fiscal year.

(a) **Big Sunflower River, etc.** The Project is authorized by the Flood Control Acts of 1944, 1946, 1950, 1962, and 1965. Swan Lake Levees plans and specifications were under preparation in FY 07. Main Canal and Black Bayou are complete. Item 66B channel relocation plans and specifications were prepared. Ten sedimentation reduction structures were completed as Phase I, and a contract was awarded for 14 additional structures as Phase II.

Mitigation for Upper Steele Projects. Mitigation for the unavoidable environmental losses is now underway. Approximately 5,569 acres of cleared lands have been obtained in the Yazoo Basin to mitigate the environmental losses resulting from construction of the Upper Steele Bayou Projects. Most of this land has been reforested and will be managed for wetlands, and terrestrial resources. All lands acquired for mitigation are from willing sellers to offset environmental losses from this project.

(b) **Flood Control Reservoirs**

(1) **Arkabutla Lake.** (See Table 41-C.) The dam and appurtenant structures were maintained and operated. Clearing of tributary streams in the lake area was

continued. Maximum pool elevation in the lake was 218.7 feet NGVD on Sep. 15, 2007, and storage in flood control pool was 106,800 acre-feet. Peak 24-hour inflow was 7,100 cubic feet per second on Apr. 15, 2007. On Sep. 30, 2007, the pool elevation was 217.3 feet NGVD, and storage in the flood control pool was 91,500 acre-feet.

(2) **Enid Lake.** (See Table 41-C.) The dam and appurtenant structures were maintained and operated. Rehabilitation of boat channels and snagging and clearing of tributary streams in the lake area continued. Maximum pool elevation in the lake was 243.1 feet NGVD on Jul. 31, 2007, when storage in the flood control pool was 173,700 acre-feet. Peak 24-hour inflow was 14,050 cubic feet per second on Jan. 6, 2007. On Sep. 30, 2007, pool elevation was 242.7 feet NGVD and storage in the flood control pool was 169,000 acre-feet. A total of 4,500 ac. ft. of storage in conservation pool was reallocated to municipal and industrial water supply in June 1998.

(3) **Grenada Lake.** (See Table 41-C.) Construction of remaining public-use facilities has been deferred pending development of cost-sharing agreements with local interests for construction and non-Federal operation and maintenance, consistent with projects for which recreation facilities are being constructed under the provisions of the Federal Water Project Recreational Act of 1965 (Public Law 89-72), as amended. Maximum pool elevation in the lake was 207.3 feet NGVD on Jan. 10, 2007, when storage in the flood control pool was 317,600 acre-feet. Peak 24-hour inflow was 22,350 cubic feet per second on Jan. 4, 2007. On Sep. 30, 2007, the pool elevation was 202.3 feet NGVD and storage in the flood control pool was 210,600 acre-feet.

(4) **Sardis Lake** (See Table 41-C.) The dam and appurtenant structures were maintained and operated. Clearing of tributary streams in the lake area continued. Maximum pool elevation in the lake was 251.5 feet NGVD on Sep. 28, 2007, when storage in the flood control pool was 371,600 acre-feet. Peak 24-hour inflow was 15,500 cubic feet per second on Jan. 7, 2007. On Sep. 30, 2007, the pool elevation was 251.1 feet NGVD and storage in the flood control pool was 361,900 acre-feet.

(c) **Greenwood, Yazoo City and Belzoni protection works.** Contract forces continued operation and maintenance of levees, drainage facilities, and pumping plant.

(d) **Main stem.** Contract forces continued operation and maintenance of channels, levees, and drainage facilities.

(e) **Reformulation Study.** The uncompleted portions of the Yazoo Basin construction program are currently being reformulated. This reformulation study includes investigations of the engineering, economic, and environmental aspects of the basin and is being accomplished in 4 phases. These studies will evaluate reasonable arrays of alternatives to the project features that remained after construction of items that were budgeted and scheduled for award in FY 90. The Upper Steele Bayou and Upper Yazoo Projects reports were approved on May 25, 1993 and Jun. 21, 1994, respectively. Concerning the final 2 phases, the Yazoo Backwater Reformulation Study includes nonstructural, structural, and combination plans. Nonstructural features include conservation and water management easements and reforestation of cleared agricultural lands. Structural features include a pump station and levee alternative. The Yazoo Backwater Reformulation Study's draft report and Draft Supplemental Environmental Impact Statement (SEIS) were released for public review in Sep. 2000. The Vicksburg District reviewed and incorporated public and agency comments into the Final Report and Final SEIS. The Final Report is scheduled to be released in Nov. 2007 with a public comment period to be open until Jan. 2008. The Yazoo Tributaries Reformulation Study is evaluating flood control requirements on nine project features. Study efforts were suspended in 2000, and are scheduled to be reinitiated in FY 07.

(f) **Delta Headwaters Project.** The Delta Headwaters Project (DHP), a joint project with the USDA NRCS was initiated by FY 85 appropriations as a continuation on streambank erosion control efforts. The purpose of the project is to demonstrate the applicability of a systems approach to the design of erosion, sedimentation, and flood control works by applying this approach to 16 demonstration watersheds in the Yazoo Basin hill area. During FY 07, work continued in the

MISSISSIPPI RIVER COMMISSION

DHP toward development of the systems plans and implementation of a monitoring program. Cumulative through FY 07, the District has completed the construction of 206 low drop grade control structures, 203 miles of bank stabilization, 17 miles of channel improvement, 66 box culverts, 6 high drop grade control structures, 1,396 riser pipe grade control structures, 7 floodwater retarding structures, and 9 miles of levees.

(h) **Tributaries.** Project to be reformulated.

(i) **Upper Yazoo Projects.** The first 13 items of channel improvement, approximately 116 miles, and nine drainage structures have been completed. This work extends from Yazoo City, Mississippi, to Philipp, Mississippi.

The Fort Pemberton Flood Control Structure was completed on Apr. 29, 1991.

Roebuck Lake and Fort Loring water control structures and Tchula Lake weirs were completed in FY 95.

Item 6A was awarded in Aug. 07 and Item 7A is scheduled for award in Oct. 08. Design efforts continue for Channel Item 7.

The Alligator-Catfish water control structure was completed in FY 98. This structure has been renamed the J. Tol Thomas Water Control Structure.

Mitigation for Upper Yazoo Projects. Mitigation for the environmental impacts is now underway. Approximately 10,919 acres of cleared, frequently flooded agricultural lands have been obtained in the Yazoo Basin area of Mississippi to mitigate the environmental losses resulting from construction of the Upper Yazoo Projects, Big Sand Creek, Pelucia Creek, and Ascalmore-Tippo Bayou construction projects. This land has been reforested and will be managed for terrestrial, aquatic, wetlands, and waterfowl. A total of 17,000 acres of mitigation will be acquired from willing sellers for this project.

(j) **Yazoo Basin backwater.** The Yazoo area backwater levees are complete, including the backwater levee from the Mississippi River levee to the west levee

of the lower Auxiliary Channel, the Little Sunflower River drainage structure, and the connecting channel from the Steele Bayou drainage structure to the Big Sunflower River.

The Satartia area backwater levee is complete. Rocky Bayou area levee Items 1A and 1B have been completed. Completed backwater levees will require raising to provide the degree of protection intended based on the project design flow line developed for the Mississippi River following the 1973 flood.

Four Greentree Reservoirs and pumping stations have been constructed to mitigate for the waterfowl impacts of the project.

Mitigation of the terrestrial impacts is now underway. Approximately 8,800 acres of cleared, frequently flooded, agricultural lands have been obtained in the Yazoo Backwater area of Mississippi to mitigate the terrestrial losses resulting from construction and operation of the Yazoo Area and Satartia Area levees projects. This land has been reforested and will be managed for terrestrial wildlife. An additional 3,848 acres of mitigation is being considered as part of the Yazoo Backwater Reformulation Project.

Condition as of Sep. 30. The first feature of Yazoo Basin project was started in 1936, and the total project is about 68 percent complete.

Memphis District

BAYOU METO BASIN, AR

Location. Project is located in east central Arkansas in Lonoke, Pulaski, Prairie, Jefferson, and Arkansas Counties.

Existing project. The major problems are agricultural flooding, loss of environmental resources, and the depletion of the alluvial aquifer, which provides essentially all the water used for agricultural irrigation and baitfish farming and supports area wetlands. Features being evaluated include diversion of excess water from the Arkansas River with delivery through a system of new canals, existing ditches, and pipelines to the water

depleted areas; channel improvements and pumping station(s) to provide outlets for reduced flooding; waterfowl conservation and management measures; and other waterfowl enhancement features. The sponsor is the Arkansas Natural Resources Commission, partnering with the Bayou Meto Water Management District.

Operations and results during fiscal year. Funds were included in FY 2007 work plan to complete the review of the general reevaluation report.

Condition as of Sep. 30. The ASA(CW) approved the General Reevaluation Report on September 24, 2007.

Local interests have formed an entity capable of providing the legal and financial assurances for project implementation and they desire the earliest possible project completion.

FRANCIS BLAND FLOODWAY DITCH (EIGHT MILE CREEK), ARKANSAS

Location. The project is located in the City of Paragould, AR.

Existing project. The existing project consists of 12.5 miles of channel improvements. Eight miles of channel enlargement will occur in the rural downstream area of Paragould. Three and a half miles of enlargement will occur in the City of Paragould along with one mile of channel riprap/stabilization. The project will provide 100 year flood protection within the City of Paragould.

Local cooperation. A project Cooperation Agreement (PCA) was assigned in June 1996.

Operations and results during fiscal year. Construction of the final phase, Item 2, Phase 2, Urban Channel Enlargement, was completed in November 2006.

Conditions as of Sep. 30. Coordination of project closeout with the sponsor is underway. The final activity will be the revision of FEMA's flood plain maps via a Letter of Map Revision.

GERMANTOWN, TN

Location. The study area is located in the city of Germantown, in Shelby County, Tennessee.

Existing project. The study investigated possible solutions to the flooding, erosion, and water quality problems impacting three drainage basins: Miller Farms Ditch and Lateral D, tributaries to the Wolf River and Howard Road Outfall, a tributary to Nonconnah Creek.

Operations and results during fiscal year. Only one of the three drainage basins investigated (Lateral D) resulted in a plan that is economically feasible; however, the outputs for this plan (erosion control) are not high priority outputs and not budgetable. Therefore, the feasibility study was terminated and the report was not processed for approval. The estimated cost of the Lateral D plan is \$6.0 million and the benefit to cost ratio is 1.44.

Condition as of Sep. 30. The city of Germantown attempted to obtain authority from Congress to construct not only Lateral D, but also locally developed plans for Miller Farms, Howard Road, and other drainage basins in the area, by requesting a modification to Section 219 of WRDA 1992, as amended. Section 1003 of WRDA 2007 authorizes the study of these basins from a Section 14, Emergency Streambank Protection standpoint, but does not authorize provisions for flood damage reduction. Funding has been appropriated for the Lateral D basin and a Section 14 study will be initiated in FY 2008.

GRAND PRAIRIE REGION, AR

Location. Project is primarily located in Arkansas and Prairie Counties and a small portion in Lonoke and Monroe Counties.

MISSISSIPPI RIVER COMMISSION

Existing project. This project will provide for agricultural water supply, ground water protection, and fish and wildlife restoration and enhancement. The project includes a major pumping station, conveyance channels, and conservation measures for the Grand Prairie area. The sponsors are the State of Arkansas and the White River Regional Irrigation Water Distribution District.

Operations and results during fiscal year. FY 2007 funds are being used for termination costs of the pumping station contract (including completion of the fabrication/delivery of the pumps and motors); development of a Programmatic Agreement between the Corps and the appropriate American Indian tribes to address cultural requirements; and completion of the Biological Assessment concerning the ivory-billed woodpecker (IBW). Construction has been fully suspended on the pumping station, which is about 20 percent complete. Negotiations with the contractor to remove the Continuing Contract clause were unsuccessful and without funds to fully fund the entire contract, Termination for Convenience of the government was required.

Condition as of Sep. 30. Construction on the pumping station began during the summer of FY 2005 and was scheduled for completion in September 2007. However, the contract had to be terminated for the convenience of the Government in order to comply with the provisions of P.L. 109-103. In addition, in July 2006, an injunction was issued due to issues related to the Endangered Species Act and the Ivory-billed Woodpecker habitat.

HORN LAKE CREEK AND TRIBUTARIES INCLUDING COW PEN CREEK, TENNESSEE AND MISSISSIPPI

Location. Horn Lake Creek is located in northwest Desoto County, MS and southwest Shelby County, TN.

Existing project. The project was approved for construction on Nov. 17, 1986, under authority of Title IV, Section 401 of the 1986 Water Resources Development Act. The project consists of 3.5 miles of drift removal and 2.75 miles of channel clearing on Horn Lake Creek; 2.1 miles of channel clearing on Rocky Creek and 0.62 miles of channel clearing and 1.85 miles of channel enlargement on Cow Pen Creek. The project will provide 1.1-year flood frequency protection on Horn Lake and Rocky Creeks and 25-year

flood frequency protection on Cow Pen Creek. The construction is complete.

Local cooperation. A Local Cooperation Agreement was executed with the Horn Lake Creek Watershed Drainage District on Feb. 26, 1992.

Condition as of Sep. 30. Completed final accounting and reimbursed the sponsor for cost-share overpayment.

MISSISSIPPI RIVER LEVEES

Operations and results during fiscal year. Minor maintenance on levees is performed by the local interests and major maintenance is performed as required for slide repairs, road rehabilitation, and other similar work by the U.S. Army Corps of Engineers.

Mississippi River Levees Construction. St. Johns – New Madrid box culverts and levee closure was awarded 4 August 2004 and initiated in September 2006; was suspended in August 2007 due to unfavorable court ruling. Hillhouse, MS, relief wells P-2; Mounds Creek, IL, culverts; Nash, MO, Relief Wells P-2; and Fritz Landing, TN, culvert were completed. Farrell, MS, and Badgers to Cottonwood Point, AR, relief wells and West Memphis, AR, and Caruthersville, MO, relief well correction were awarded in FY 2007. All FY 2007 awards are less than 10 percent complete.

Mississippi River Levees Maintenance. Initiate and Complete – Levee Slide Repairs; Levee Slope Stabilization at Pecan Point, AR; Levee Slope Stabilization at Gammon, AR. Initiate Levee Slope Stabilization at West Memphis, AR.

CHANNEL IMPROVEMENT

Operations and results during fiscal year. Maintenance on dikes and revetments were performed by the U.S. Army Corps of Engineers. Continued construction of new dikes and revetments in the Main Stem Mississippi River System. See Table 41-J.

Channel improvement. Stone Dike Construction at Randolph, TN, awarded July 2007, 100 percent complete as of 30 September 2007. Stone Dike Construction at Lower Bullerton, AR, awarded June 2007, 100 percent complete as of 30 September 2007. Construction of 0.67 mile of new bank revetment and 36,528 squares of concrete mattress, for maintenance,

along the Mississippi River was completed by Government plant and hired labor. Also, 2.71 miles of new dikes were constructed and required maintenance was performed.

NONCONNAH CREEK, MS AND TN

Location. The project is located in southern Shelby County and provides flood protection for approximately half of the city of Memphis, TN.

Existing project. The project is made up of five separable elements, flood control, environmental preservation, recreation and conditionally authorized extensions to the flood control and recreation elements. The flood control element is under construction and consists of 18.2 miles of channel enlargement, grade stabilization, and vegetative cleanout. The environmental element consists of a 33-acre nature area. The recreation element consists of 8.8 miles of biking/hiking trails. WRDA 2000 conditionally authorized extending the flood control element upstream about five miles and the recreational element from 8.8 to 27 miles, if the Secretary finds the work justified.

Local cooperation. The project sponsor for the authorized project is the City of Memphis, TN and the Project Cooperation Agreement (PCA) was signed on 23 July 1990. The PCA covers only the flood control features of the project. Amendment of the PCA is required to incorporate the Environmental & Recreation features of the project. The project sponsor for the conditionally authorized extensions is Shelby County, TN. A Design Agreement was signed on 16 January 2002

Operations and results during fiscal year. FY 2007 funds were used to examine options to initiate Item 2, Phase 1 channel improvements subject to successful resolution of water quality issues.

Condition as of Sep. 30. Project of the authorized 18.2 miles of flood control improvements (exclusive of the bridge/utility protection sites) is 7% completed. Item 1, Phase 2 is 100% complete. A General Reevaluation Study for the flood control and recreation extensions was completed in 2004. The study produced no viable flood control option and recreation in the extension area.

ST. FRANCIS BASIN, AR AND MO

Operations and results during fiscal year.

Construction

Contracts for Fifteen Mile Bayou, Item 1 bridge relocation at U.S. Highway 79, and County Road at mile 13.8, are 100% complete. A contract for channel enlargement on Fifteen Mile Bayou, Item 1 is 100% complete. A contract for construction of County Road Bridge 18.8 is 100% complete. A contract for construction of County Road Bridge 20.01 was awarded in August 2007 and is complete.

Condition as of Sep. 30. Project initiated 1937. Project is 90% complete.

Maintenance

Continue Scour Repairs at Bridges – Madison to Marianna, AR. Initiate and Complete - Levee Gravel Resurfacing – Elk Chute East Levee, MO; East St. Francis Levee, Cross County, AR; Cockleburr Slough and West Levee, Craighead County, AR; Drainage District #16 of Mississippi County, AR. Initiate and Complete – Levee Slide Repairs, AR and MO; Culvert Replacements on Ditch 19, MO. Complete – Drainage District #17 Fuel Tank Replacement, AR; Dudley Ditch Grade Control Structure, MO.

ST. JOHNS BAYOU AND NEW MADRID FLOODWAY

Location. This flood control project is located in the bootheel of MO. It covers two drainage basins adjacent to the Mississippi River: the St. Johns Bayou Basin (450 sq mi) and the New Madrid Floodway (180 sq mi).

Existing project. The First Phase of the authorized project includes 24 miles of channel improvements, pumping stations, all seasonal ponding easements, and appropriate mitigation features. The First Phase project has a benefit-cost ratio of 1.11 to one, with average annual benefits of \$462,000 (Final RSEIS 2, March 2006, p. 135). St. John Levee and Drainage District is the cost-sharing sponsor. The current estimated cost for programmed work is \$50,100,000 Federal and \$16,500,000 non-Federal.

MISSISSIPPI RIVER COMMISSION

Condition as of Sep. 30. Remaining construction work on the First Phase includes approximately 19.7 miles of channel improvements and two pumping stations. Water Quality Certification was issued for the project in Jun 2003. A contract was awarded for the New Madrid pumping station in Sep 2004. Construction was not initiated due to a Complaint filed in Federal Court in Sep. 2004 which resulted in the production of an amended environmental NEPA document (RSEIS 2, March 2006). This document is resulted in a Record of Decision on May 23, 2006 and a notice to proceed was issued to the contractor on August 28, 2006. Construction was initiated in September 2006. The Federal Court ruled against the Corps on September 13, 2007, and construction was suspended on September 14, 2007. A Notice of Appeal was filed on November 9, 2007, but the Solicitor General must approve the recommendation to appeal before plaintiffs can proceed with an appeal.

WEST TENNESSEE TRIBUTARIES, TN

Location. The project is a flood control project located along the Obion and Forked Deer Rivers and tributaries in west Tennessee, in Weakley, Madison, Gibson, Obion, Dyer, Crockett, Lauderdale and Haywood Counties.

Existing project. The project consists of 225 miles of channel improvements on the Obion and Forked Deer Rivers and construction of 7.6 miles of levees to provide adequate drainage outlets and reduce flooding; 174 water control structures, 216 erosion control structures, 37 miles of water management connector channels to restore bottomland hardwoods and fisheries; and the acquisition of 32,000 acres of mitigation lands. Only 93 miles of the authorized channel improvements have been completed and 13,527 acres of the mitigation lands purchased.

Local cooperation. The project sponsor is the state of Tennessee acting through the West Tennessee River Basin Authority (WTRBA).

Operations and results during fiscal year. No contract awarded or completed during fiscal year.

Condition as of Sep. 30. WTRBA requested that the Corps undertake a reevaluation of a demonstration project along the Obion River System to alleviate

unresolved water resource problems in the West Tennessee area. FY 2006 funds were used to research potential sites for a demonstration study. The West Tennessee Tributaries Project is 60 percent complete.

WOLF RIVER, MEMPHIS, TN

Location. The Wolf River is located in Hardeman, Fayette, and Shelby Counties, TN, and Tippah, Marshall, and Benton Counties, MS.

Existing project. The authorized project consists of six main channel weirs and eighteen tributary weirs for grade stabilization, two cutoff prevention weirs on the main channel, trails, and wildlife corridors in Shelby County, and three boat ramps (two in Shelby County and one in Fayette County.) Estimated annual benefits include over 2,144 annual habitat unit values and \$414,000 in recreational benefits. The project sponsors are Shelby County, Tennessee and the Chickasaw Basin Authority.

Operations and results during fiscal year. The first construction contract consisting of three stabilization weirs, one cutoff prevention weirs, one tributary weir, and associated access roads is complete. The second item of work consisting of one weir, bridge protection, and associated access roads is complete. FY 2007 funds were being used to develop plans and specs for the third item of work (five tributary weirs, award the contract, and initiate construction on this item).

Condition as of Sep. 30. Construction was completed on the first item of work in December 2005. The second item of work was completed in October 2006. The third item of work was awarded in July 2007 and construction was initiated in August 2007.

St. Louis District

Operations and results during fiscal year.

WAPPAPELLO LAKE, MISSOURI

Wappapello Lake. The dam and appurtenant structures were maintained and operated. Phase 1 of State Highway D-5 relocation project was awarded in accordance with 1997 REDM. Five-year periodic inspection of the dam was completed. Maximum pool elevation was 372.18 ft. NGVD on May 14, 2007, when

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

storage utilized in the flood control pool was 167,068 acre-feet (23%). Peak 24-hour inflow was 29,980 cfs on May 3, 2007. On September 30, 2007, the pool elevation was 360.33 ft. NGVD and storage utilized in the flood control pool was 36,858 acre-feet (6%).

On November 15, 2006, the Chief of Engineers signed the Statement of Findings approving the relocation of US Highway 67 and Wane County Roads 313 and 536. On December 18, 2006, the ASA(CW) submitted to Congress a Notification Report for Major Relocations authorizing those road relocations.

6. Authorized by Public Law 85-500.

TABLE 41-D AUTHORIZING LEGISLATION

Act or Authorization	Work Authorized	Document
May 15, 1928	Flood protection in alluvial valley of Mississippi River, revetment and contraction works and dredging to provide least channel depth of 9 feet and width of 300 feet below Cairo.	H. Doc. 90, 70th Cong., 1st sess.
Jun. 19, 1930	Provided for allotment of the balance of emergency rescue funds to reimburse levee districts and others for expenditures in flood-control works during the 1927 and subsequent floods.	Public Law 395, 71st Cong., 2d sess.
Feb. 15, 1933	Provided for ownership of lands in Bonnet Carré Spillway and Floodway with proviso for granting rights-of-way, easements, and permits, in said lands.	Public Law 351, 72d Cong.
Apr. 23, 1934	Authorized payment for purchase of, or to reimburse states and local levee districts for the cost of, levee rights-of-way for flood-control work in the Mississippi Valley, and for other purposes.	Public Law 171, 73d Cong.
Aug. 30, 1935	Improvement of Wolf and Nonconnah Rivers, TN (Nonconnah Creek is correct title). Improvement of Wolf River (Memphis Harbor), TN.	R&H Comm. Doc. 26, 72d Cong., 1st sess. R&H Comm. Doc. 45, 74th Cong., 1st sess.
Jun. 15, 1936	Modification of the 1928 Act to provide for: Construction of a backwater levee at mouth of White River, AR. Construction of Eudora floodway in lieu of Boeuf floodway; flood control, Yazoo River; construction of Morganza floodway; and an outlet to the Gulf of Mexico west of Berwick, LA, including a 6-year program for the improvement and regularization of the Mississippi River between Arkansas and Red Rivers, and Atchafalaya River; and construction of roads on levees and drainage adjustments incident to floodway levees.	Unpublished report dated Apr. 2, 1925. H. Comm. on Flood Control, Doc. 1, 74th Cong., 1st sess.
Aug. 28, 1937	Provided for construction of floodwalls, levees, and revetments along Wolf River and Nonconnah Creek for protection of Memphis, TN. Modify the Yazoo River project to substitute a combined reservoir floodway and levee plan.	Unpublished report on record in OCE.
Jun. 28, 1938	Construction of Mounds to Mound City levee and control works along Cache River, IL. Modification of previous act pertaining to floodways and outlets and lands therein; including program for the improvement and regularization of the Mississippi River, between Cairo and Arkansas River, extension of levee road system; strengthening of levees.	H. Comm. on Flood Control, Doc. 1, 75th Cong., 1st sess. H. Comm. on Flood Control, Doc. 1, 75th Cong., 1st sess.
Aug. 18, 1941	Enlarge main line levees to offset abandonment of floodways between Arkansas and Red Rivers, flood-control works in backwater areas of Yazoo and Red Rivers, and in Bayous Rapides, Boeuf, and Cocodrie, LA.	H. Doc. 359, 77th Cong., 1st sess.

MISSISSIPPI RIVER COMMISSION

AUTHORIZING LEGISLATION

Act or Authorization	Work Authorized	Document
	Modification of the Yazoo Basin, MS, feature to provide for a streambank erosion control demonstration project for the delta and hill areas of basin.	Sec. 32, Public Law 93-251.
	Modification of project to provide that the Secretary of the Army, acting through the Chief of Engineers, can substitute authorized mitigation lands, not yet acquired and no longer suitable, for like acreage in the same or adjacent subbasins of the project area. This section provides the authority to substitute authorized mitigation lands in: a. Tensas Basin, LA and AR, feature (Red River backwater). b. St. Francis Basin, AR and MO, feature.	Sec. 42, Public Law 93-251.
	Modification of Bayou Cocodrie and tributaries, LA, feature, to provide for: enlargement of Bayou Courtableau from Washington to west protection levee; right-of-way and spoil disposal areas at Federal expense; and necessary additional culverts through west protection levee.	Sec. 87, Public Law 93-251.
	Modification of Cache River Basin, AR, feature to provide for: acquisition by fee easements of lands for fish and wildlife management, recreation, and environmental purposes.	Sec. 99, Public Law 93-251.
TITLE II River Basin Monetary Authorization Act of 1974	Continue prosecution of project for the comprehensive development of the basin, \$211 million.	Sec. 201, Public Law 93-251. Mar. 7, 1974.
River Basin Monetary Act of Oct. 2, 1975	Continue prosecution of project for the comprehensive development of the basin, \$158,000,000.	Sec. 1, Public Law 94-101.
Dec. 16, 1975 ²	Modification of St. Francis Basin, AR and MO, feature to provide relief from ponding of interior runoff in the Inter-River Drainage District of Missouri.	Unpublished Memphis District's MRC report dated Nov. 11, 1975.
TITLE II Public Works for Water and Power Development and Energy Research Appropriation Act, 1976.	Continue prosecution of project for comprehensive development during period Jul. 1-Sep. 30, 1976, \$60,300,000.	Public Law 94-180, Dec. 26, 1975.

TABLE 41-D **AUTHORIZING LEGISLATION**

Act or Authorization	Work Authorized	Document
TITLE II Public Works for Water and Power Development and Energy Research Appropriation Act, 1977.	Continue prosecution of project for flood control, rescue work, repair, restoration, and control of bank erosion, \$231,497,000.	Public Law 94-355, Jul. 12, 1976.
Water Resources Development Act of 1976.	<p>Sec. 101(a) authorized accomplishment of Phase I - Advanced Engineering and Design Memoranda-On:</p> <ul style="list-style-type: none"> a. St. Johns Bayou and New Madrid Floodway, MO, project: Report of OCE - Sep. 26,1975. b. Nonconnah Creek, TN and MS, project: Report of OCE - Jun. 23, 1976, and as an independent part of the project: Improvements for flood control and allied purposes on Horn Lake Creek and tributaries, including Cowpen Creek, TN and MS. <p>Modification of West Tennessee Tributaries feature (Obion and Forked Deer Rivers), TN, to:</p> <ul style="list-style-type: none"> a. (Sec. 102) - Provide project for flood control for Harris Fork Creek, TN and KY: (H.D. 94-221) except that highway bridge relocations and alterations shall be at Federal expense. b. (Sec. 183) - Provide for construction of a levee and appurtenant works from mouth of Obion diversion channel to vicinity Highway 88 and thence to vicinity of Porter Gap, TN. 	Public Law 94-587, Oct. 22, 1976.
TITLE II Public Works for Water and Power Development and Energy Research Appropriation Act, 1978.	Continue prosecution of project for flood control, rescue work, repair, restoration, and control of bank erosion, \$253,081,000.	Public Law 95-96 Aug. 7, 1977.
Dec. 9, 1977, 5th Ind. on VXD May 31, 1977, Letter Report. ²	Modification of the Tensas Basin Project, Red River Backwater Area, to include a drainage structure and appurtenant channel works in the Six Mile Bayou area of Concordia Parish, LA.	Unpublished Vicksburg District report dated May 31, 1977, on Cynthia and Six Mile Bayous, LA.
Jun. 28, 1980	The establishment of the Tensas River National Wildlife Refuge for the preservation and development of environmental resources and in lieu of mitigation acquisitions which otherwise would be required for certain water resources projects, within designated limits, in the basins of the Tensas, Boeuf, and Red Rivers in the State of Louisiana.	Public Law 96-285, Jun. 28, 1980.

MISSISSIPPI RIVER COMMISSION

**TABLE 41-D

AUTHORIZING LEGISLATION

Act or Authorization	Work Authorized	Document
Energy and Water Development Appropriation Act, 1981	For expenses necessary for prosecuting work of flood control projects, rescue work, repair, restoration or maintenance of flood control projects threatened or destroyed by flood, \$232,519,000: Provided, That not less than \$250,000 be available for control of bank erosion of streams in the Yazoo Basin, including the foothill area. Provided further, That funds for the Tensas Basin Red River Backwater Area, be used for flood control, etc., for Sicily Island and Below Red River including pumping stations.	Public Law 96-367, Oct. 1, 1980.
Supplemental Appropriations Bill for FY Ending Sep. 30, 1985 (PL 99-88), and the Water Resources Development Act of 1986 (PL 99-662)	Authorizes and directs the Secretary of the Army acting through the Chief of Engineers to proceed with planning, design, engineering, and construction of 41 water resources projects, including Atchafalaya Basin Floodway System. For the Atchafalaya Basin Floodway Systems project, cost-sharing is only required for the recreation feature of the project. The flood control and environmental features are Federal costs.	FY 1985 Supplemental Appropriations Bill (PL 99-88), and Water Resources Development Act of 1986 (PL 99-662).
Water Resources Development Act, 1986	<p>Sec. 104(a), Authorization of Projects - Authorization of Construction:</p> <p>Incorporation of the project for flood control, Louisiana State Penitentiary levee, Mississippi River, LA: Report of the Chief of Engineers, dated Dec. 10, 1982, at a total cost of \$23,400,000, with an estimated first Federal cost of \$17,600,000 and an estimated first non-Federal cost of \$5,800,000. No acquisition of land for or actual construction of the project may commence until appropriate non-Federal interests shall agree to undertake measures to minimize the loss of fish and wildlife habitat lands in the project area. The work is unscheduled.</p> <ol style="list-style-type: none"> a. Bushley Bayou, LA. Water Resources Development Act of 1986 authorized the project for flood control, Bushley Bayou, LA. b. Eight Mile Creek, Paragould, AR. Project entails channel improvement along the creek with miniparks and hiking/ biking trails. c. Helena and Vicinity, AR. The Helena Basin is an urban basin containing approximately 3,500 acres which frequently and severely floods the city of Helena. A pumping station and sump with channel enlargement and a gated culvert was recommended. d. West Memphis and Vicinity, AR. Channel improvements along Ten Mile Bayou and Fifteen Mile Bayou for a total of 23.86 miles, with limited revegetation of right-of-way to maintain environmental stability. e. St. Johns Bayou and New Madrid Floodway, MO. Flood control for urban and rural land. 	Public Law 99-662, Nov. 17, 1986.

TABLE 41-D **AUTHORIZING LEGISLATION**
(Continued)

Act or Authorization	Work Authorized	Document
Energy and water Development Appropriation Act, 1994	f. Nonconnah Creek and Johns Creek, TN and MS. Channel enlargement, recreation features with channel construction and environmental enhancement.	
	g. Horn Lake Creek and Tributaries, TN and MS. This is an urban flood control project located in extreme northwest Mississippi and southwest Tennessee. The plan of improvement consists of 3.5 miles of selective drift removal on lower Horn Lake Creek and 2.6 miles of vegetative clearing on Horn Lake Creek, 2.1 miles on Rocky Creek and 0.6 miles of vegetative clearing and 1.8 miles of channel enlargement on Cow Pen Creek. Hike/bike trails are included along Rocky Creek and Cow Pen Creek.	
	h. Atchafalaya Basin Floodway System, La. Not mentioned, but this Act authorized basic cost sharing principles for the project. In particular establishes that the fish and wildlife enhancement feature of the project is of national significance, and therefore, a 100 percent Federal cost.	
	i. Lower Atchafalaya Basin Reevaluation Study. Authority to, within available funds, investigate conditions at Wax Lake Outlet, Bayou Black, and other features, and recommend any modification desirable for flood protection navigation, and environmental program.	
	Sec. 601(a) Authorization of Projects. Authorization of Construction:	
	a. Yazoo Backwater Area, MS. Authorized the project for mitigation of fish and wildlife losses at the Yazoo Backwater Project, MS. The project shall include acquisition of 40,000 acres for mitigation of project-induced fish and wildlife losses.	
	b. Greenville Harbor, MS. Authorized the project for navigation, Greenville Harbor, MS, as contained in the reports of Chief of Engineers, Nov. 15, 1977 and Feb. 2, 1982, at a total cost of \$43,700,000 with an estimated first Federal cost of \$28,000,000 and an estimated non-Federal first cost of \$15,700,000.	
	c. Vicksburg Harbor, MS. Authorized the project for navigation, Vicksburg Harbor, as contained in the report of the Chief of Engineers, Aug. 13, 1979, at a total estimated first Federal cost of \$55,900,000 and an estimated non-Federal first cost of \$23,300,000.	
	d. Helena Harbor, Phillips County, AR. The recommended plan consists of dredging a navigation channel to provide access to 685 acres of landfill; construction of an overlook park; implementing landscaping and erosion control measures; and mitigation fish and wildlife losses. The project is scheduled to be constructed in two phases.

AUTHORIZING LEGISLATION

Act or Authorization	Work Authorized	Document
	<p>e. White River Navigation to Batesville, AR. The plan of improvement recommended in the Feasibility Report provides for construction and maintenance to provide a 200-foot wide, 9-foot deep channel available 95 percent of the time from mile 10 (Arkansas Post Canal) to mile 254, two scenic overlooks, a primitive camping area, and acquisition of about 1,865 acres of woodlands for mitigation. However, section 52 of the Water Resources Development Act of 1988 deauthorized this project.</p> <p>f. Obion Creek, KY. To prevent headwater flooding along tributary streams and backwater flooding of alluvial lands.</p> <p>g. Memphis Harbor, Memphis, TN. This is a navigation project in the vicinity of Memphis, TN, which would consist of dredging and maintaining a 4.9 mile long, 500-foot minimum width, 9-foot deep general navigation channel with additional dredging as required and strategic placement of dredged material to create and provide navigation access to 1,000 acres to be developed as a waterfront industrial complex.</p> <p>Sec. 806. Reelfoot Lake, KY. This project is modified to provide that the Federal share of the cost of operating the pumping plant feature of such project shall be 50 percent.</p> <p>Sec. 836. Mud Lake, Western Tennessee Tributaries. This project is modified to provide that the requirements of local cooperation shall be (1) 50 percent of the value of the lands, easements, and rights-of-way, (2) to hold and save the United States free from damages due to the construction works, and (3) to maintain and operate all the works after completion.</p>	
Jun. 4, 1987	Modification of Mississippi Delta Region project to construct salinity control structure at Davis Pond (mile 118) rather than at Myrtle Grove (mile 59).	Unpublished New Orleans District report, Nov. 1, 1984.
Water Resources Development Act, 1988	<p>Sec. 3(a), Project Authorizations - Authorization of Construction:</p> <p>a. Mississippi-Louisiana Estuarine Area, MS and LA. Authorized the project for environmental enhancement, as contained in the report of Chief of Engineers, dated May 19, 1986, at a total cost of \$59,300,000.</p>	Public Law 100-676 Nov. 17, 1988
Water Resources Development Act, 1988	<p>Section 4(b) West Memphis and Vicinity, AR. Modified the project by allowing that non-Federal cooperation may be provided by levee districts, drainage districts, or any unit of a state, county, or local government.</p>	Public Law 100-676, Nov. 17, 1988

MISSISSIPPI RIVER COMMISSION

TABLE 41-D **AUTHORIZING LEGISLATION**

Act or Authorization	Work Authorized	Document
Water Resources Development Act, 1996	White River, Arkansas The project for navigation, White river Navigation to Batesville, Arkansas, authorized by section 601(a) of the Water Resources Development Act of 1986 (100 Stat 4139) and deauthorized by section 52(b) of the Water Resources Development Act of 1988 (102 Stat. 4044), is authorized to be carried out by the Secretary.	Public Law 104-303 Oct 12, 1996
Water Resources Development Act, 1999	Memphis Harbor, Memphis, Tennessee Authorized to be carried out by the Secretary, if the Secretary determines that the project is technically sound, environmentally acceptable, and economically justified, as appropriate.	Public Law 106-53 Aug. 17, 1999
Water Resources Development	Tunica Lake Weir, Mississippi The Secretary shall conduct a study to determine the feasibility of constructing an outlet weir at Tunica Lake, Tunica county, Mississippi, and Lee County, Arkansas, for the purpose of stabilizing water levels in the lake. In carrying out the study, the Secretary shall include as part of the economic analysis the benefits derived from recreation uses at Tunica Lake and economic benefits associated with restoration of fish and wildlife habitat.	Public Law 106-53
Water Resources Development Acts, 1986, 1990 and 1999	Louisiana State Penitentiary Levee, Mississippi River, Louisiana Authorizes and directs the Secretary of the Army, acting through the Chief of Engineers to proceed with planning, design, engineering, and construction of improvements of 12 miles of existing levee along the Mississippi River which provides flood protection to the Louisiana State Penitentiary at Angola, LA. This act authorizes basic cost sharing principles, and establishes that the cost sharing will be shared on a 75%/25% basis with the state of Louisiana for this project. Authorizes the Secretary of the Army to consider credit for work performed by a non-Federal sponsor since project authorization.	Public Law 99-662 Nov. 17, 1986 Public Law 101-640 Nov. 28, 1990 Public Law 106-53 Aug. 17, 1999
Omnibus Consolidated and Emergency Appropriations For Fiscal Year 2001	Ten and Fifteen Mile Bayous, St. Francis River Basin, Arkansas Modified Section 204 of the Flood Control Act of 1950 to expand the boundaries of the project to include Ten- and Fifteen-Mile Bayous near West Memphis, Arkansas. Notwithstanding section 103(f) of the Water Resources Development Act of 1986, the flood control work at Ten- and Fifteen-Mile Bayous shall not be considered separable elements of the project.	House Report 4577 Dec 15, 2000

1. Landside seepage berms only.
2. Levee that has adequate freeboard based on the refined 1973 MR&T project flood flow line for the Mississippi River. Levees with more than 2 feet of freeboard are considered adequate.
3. Subject to change as planning progresses. Does not include existing berms which need restudy.
4. Includes 1.4 miles of concrete floodwall and 0.3 mile of levee on Vicksburg city front.
5. Includes 5.3 miles for Gillett new levee.
6. Relief wells used in place of berms.
7. Changed to correct previous error.

1. Landside seepage berms only.
2. Subject to change as planning progresses.
3. 1996 Revised Project Design Flood flowline identified freeboard deficiencies.
4. Changed to correct previous error.
5. Relief wells have been used in lieu of seepage berms in some reaches of the Miss. River Levees.

Project	Funding	FY04	FY05	FY06	FY07	Total Sep. 30, 2007
1. Appropriations were as follows:						
Appropriations chargeable against Flood Control Act authorizations:						
Flood Control, MR&T except for emergencies (excludes Maintenance allotments Aug. 18, 1941, through Sep. 30, 2007):						
Net total allotted for works under Mississippi River Commission:					8,258,380,715	
Eight-Year Program Funds, Construction General:					10,281,695	
Surveys under Sec. 10, Flood Control Act of 1928 (not under MRC):					4,995,215	
Transferred to revolving fund:					24,944,460	
Impounded savings:					1,593,097	8,300,195,182
Flood control emergencies:						
Net total allotted:					14,885,922	
Impounded savings:					14,378	14,900,300
Additional funds not chargeable against Flood Control Act authorizations:						
Appropriations for Flood Control, MR&T, except for flood control emergencies:						
General investigations:					176,550,140	
Maintenance allotments Aug. 18, 1941, through Sep. 30, 2007					4,558,988,893	
Rehabilitations:					31,113,000	4,766,652,033
Appropriations in addition to appropriations for Flood Control, MR&T (itemized in footnote (1), pp 2068-69, Annual Report for 1953):					32,068,909	32,068,909
Budgetary and OCE Reserves:						
Grand total:						<u>13,113,816,424</u>
Reconciliation of appropriations and allotments:						
Total allotted to Sep. 30, 2007:					13,082,269,274	
Transferred to revolving fund:					24,944,460	
Surveys under Sec. 10, Flood Control Act of 1928 (not under MRC):					4,995,215	
Impounded savings withdrawn by Chief of Engineers:					1,607,475	
Total Appropriations to Sep. 30, 2007:					<u>13,113,816,424</u>	
Appropriations for past four reporting periods were as follows:						
		FY 04: \$322,308,000				
		FY 05: \$303,904,000				
		FY 06: \$409,560,675				
		FY 07: \$390,904,615				
Supplemental Appropriations for past two reporting periods were as follows:						
		FY06: \$153,771,000				
		FY07: --				

2. Totals for General Investigations include four projects transferred from Construction totals per DAEN-CWB-W, Aug 4, 1978, teletype.

Mississippi River Drainage Basin

The seven-member Presidentially appointed Mississippi River Commission is responsible for the comprehensive Mississippi River and Tributaries project and engineering work associated with the Mississippi River drainage basin which impacts 41% of the United States and includes 1.25 million square miles, more than 250 tributaries, 31 states, and 2 Canadian provinces.

U.S. ARMY ENGINEER RESEARCH AND DEVELOPMENT CENTER

BACKGROUND

The research and development (R&D) laboratories of the U.S. Army Corps of Engineers (USACE) have served the Corps, the Army, and the Nation with technical accomplishments in a variety of engineering and scientific fields for almost 80 years. From its beginnings in 1929 as a small hydraulics laboratory established in Vicksburg, MS, to assist in developing a comprehensive plan for flood control of the Mississippi River, the Engineer Research and Development Center (ERDC) has evolved into a world-class R&D organization with the expertise needed to solve complex civil engineering and environmental science challenges for the Corps. ERDC is headquartered in Vicksburg, MS, and offers a centrally managed center of seven unique laboratories located in Illinois, Mississippi, New Hampshire, and Virginia.

At the close of FY 2007, ERDC had 1661 full-time permanent employees of whom 992 are highly trained engineers and scientists. The full-time permanent professional staff encompassed 278 Ph.D. and 426 Master's degrees.

In FY 2007, ERDC executed a Civil Works program totaling \$120.3 million. Of this total, \$90.4 million was executed in direct-allotted programs, with \$39.1 million in R&D programs and \$51.3 million in data acquisition, demonstration, study, and technical support programs. The remaining \$29.9 million was executed in support of USACE District and Division offices.

LABORATORIES

The diverse civil engineering and environmental quality R&D center consists of seven centrally managed laboratories located at Alexandria, VA; Champaign IL; Hanover, NH; and Vicksburg, MS. With world-renowned expertise and facilities, each laboratory adds a unique perspective and set of capabilities to the overall ERDC team. Following are brief descriptions of the ERDC laboratories.

Coastal and Hydraulics Laboratory

The Coastal and Hydraulics Laboratory (CHL), Vicksburg, MS, is the Nation's center for engineering and scientific R&D in the coastal, hydraulic, and hydrologic engineering and sciences. CHL conducts research and supports the Corps of Engineers in conducting its navigation, flood and coastal storm damage reduction, environmental restoration, and military engineering missions. CHL is comprised of nationally and internationally recognized experts that perform research and site-specific investigations in the fields of erosion control design; navigation engineering; channel design; fisheries engineering; sediment transport; estuarine engineering; dredging; hydrodynamics; groundwater, watershed, surface water, coastal, and ocean modeling; coastal storm and flood damage protection; harbor design and modification; coastal and hydraulic structures; physical processes associated with water resources; environmental problems; military logistics-over-the-shore; wave climatology; and hydroinformatics.

Cold Regions Research and Engineering Laboratory

The Cold Regions Research and Engineering Laboratory (CRREL), Hanover, NH, maintains the finest research and engineering staff and facilities in the world for the study of cold regions science and technology. CRREL is recognized for its internationally known experts in the field of ice jam flooding and ice-hydraulics; ice control at locks, dams, and other navigation channels; snowmelt modeling and simulation; and other areas ranging from geotechnical aspects of frozen ground to new admixtures for placing concrete in the winter. CRREL's specialized research facilities include a complex of cold rooms, an Ice Engineering Facility housing three special-purpose research areas; a large low-temperature towing tank, a refrigerated flume for modeling rivers, and a large hydraulic model room. CRREL is also home to the U.S. Army Corps of Engineers Center of Expertise for Civil Works Remote Sensing/Geographic Information Systems.

Construction Engineering Research Laboratory

The Construction Engineering Research Laboratory (CERL), Champaign, IL, provides construction research to address the entire spectrum of issues within military construction. This research supports sustainable military installations and encompasses construction, operations, and maintenance as well as environmental and safety concerns. These technologies have universal application and are of value in the Civil Works arena as well. Civil Works efforts are in the areas of corrosion control, high-performance protective coatings (including overcoating of lead-based paint), management tools for Operation and Maintenance optimization, environmental compliance, and environmental sustainment.

Environmental Laboratory

The Environmental Laboratory (EL), Vicksburg, MS, conducts multi-disciplinary research in environmental quality and ecosystem restoration. EL's research activities consist of evaluating and projecting the consequences of water resources development, navigation, and dredging on the environment; assessing and restoring wetlands; evaluating and modeling inland and oceanic water quality; guiding stewardship of natural resources; and developing tools for cleanup of contaminated groundwater and soils.

The laboratory has developed resource management technologies to: guide Corps stewardship at projects; improve stream and riparian restoration; accelerate growth of desirable vegetation/habitat; implement risk and decision frameworks in planning; apply biological, chemical, and physical control agents to manage nuisance and invasive aquatic plants; apply risk-based contaminated sediment and soil toxicological assessment protocols; perform upland disposal testing and assessment for dredged material; and apply innovative environmental engineering solutions to water systems that supply irrigation needs, water supply, and other low-flow requirements.

Geotechnical and Structures Laboratory

The Geotechnical and Structures Laboratory (GSL), Vicksburg, MS, conducts research in soil and rock mechanics, earthquake engineering and

geophysics, tunneling and trenchless technology, engineering geology and seismology, vehicle mobility and trafficability, unexploded ordnance detection, and pavement technology. The laboratory also determines the response of structures to weapons effects and other loadings, investigates methods for making concrete and other materials more durable and economical, studies the application of explosives technology to military and civilian engineering, and investigates the behavior of earth/structure systems subjected to blast loading and projectile penetration. GSL is a world leader in research on effects of earthquakes on embankment dams and the evaluation, maintenance, and rehabilitation of mass concrete and steel and reinforced structures.

Information Technology Laboratory

The Information Technology Laboratory (ITL), Vicksburg, MS, advances, applies, and delivers information technologies that address a wide range of engineering, scientific, and management challenges. ITL manages one of the four High Performance Computing Major Shared Resource Centers formed under the auspices of the DoD High Performance Computing Modernization Program. ITL also manages the Computer-Aided Design and Building Information Modeling (CAD/BIM) Technology Center, a multi-agency vehicle to coordinate CAD/BIM activities within DoD. ITL is highly recognized for its expertise in the areas of Facilities Management technologies required by Army Civil Works projects; computer-aided interdisciplinary engineering and analysis; software engineering and informatics; scientific visualization; support to R&D and application efforts requiring sensor and instrumentation technologies; and library and information systems science services and collaborative technologies.

Topographic Engineering Center

The Topographic Engineering Center (TEC), Alexandria, VA, provides new topographic capabilities in geospatial science to the Corps of Engineers to ensure superior implementation of the Nation's civil and environmental initiatives through research, development, and application of remote sensing; geographic information: global positioning; and topographic, hydrographic, and information technologies. TEC scientists and engineers continue to develop faster, more accurate, and cost-effective

ways to use new remote sensing technologies to describe, characterize, and analyze the surface of the earth. Remote sensing technologies form an essential part of a new national approach to infrastructure engineering and environmental stewardship.

ARMY CIVIL WORKS R&D PROGRAMS

The Army Civil Works R&D Program is formulated to directly support the established business lines of the Civil Works Program, including flood and coastal storm damage reduction, inland and coastal navigation, environment (including natural resources, compliance, mitigation, and restoration), water supply, hydropower, recreation, emergency management, and regulatory.

Civil Works R&D needs and requirements are identified based on the current Civil Works Program Strategic Plan, Corps Division and District input, and existing authorities under the Water Resources Development Act. The R&D effort is a problem-solving process by which the Corps systematically examines new ideas, approaches, and techniques and develops field-ready products to reduce costs and improve quality of its planning, design, construction, and operations and maintenance (O&M) activities in an environmentally sustainable manner. In order to most effectively use the limited R&D resources and to avoid unnecessary duplication of research effort, the Civil Works R&D Program maintains external technical exchange and technology transfer efforts with other federal and major water resource agencies, International Boundary Water Commission, International Joint Commission, the Navy, and state and local governments.

Most of the activities that comprise R&D are funded out of the Investigations Appropriations. Other R&D activities are funded out of the Operations and Maintenance Appropriations and Construction Appropriations. Under the Investigations R&D program, the primary business lines supported by R&D include Navigation, Flood and Coastal Storm Damage Reduction, and Environmental Restoration. Additional research serves to cut across and support all business lines. In particular, the System-Wide Water Resources Program serves multiple business needs. The major R&D program areas are described in further detail below.

Other activities performed by ERDC are in the category defined as technical support, technology transfer, data collection and processing, or demonstration activities. These efforts play a vital role in the overall R&D process by ensuring new technologies are validated and fully deployed to the primary users, the Corps Districts. Descriptions of the major efforts in this category follow the R&D program descriptions.

Navigation Systems Research Program

The Corps provides inland and coastal navigation capability essential to the national economy and defense. Corps projects also provide 25% of the Nation's hydropower. The Navigation research area is funded under the Investigations appropriation. Navigation research, which includes hydropower, delivers tools and guidance essential for improved reliability, increased efficiency, and sustainable increased capacity of the complex and aging transportation/power network. The Navigation research framework integrates water dynamics, infrastructure mechanics, advanced materials, power physics, economics, innovative construction, coastal and riverine processes, automated control and monitoring, remote sensing, operations research, stochastic processes, and emerging technologies to produce effective solutions for the multiple demands, requirements, and constraints of real world commodity transport and power production problems. Research efforts target navigation channels, locks, jetties, breakwaters, dams, and power plants to facilitate improved asset management of navigation and hydropower infrastructure. Research includes techniques for optimizing life-cycle and reliability trade-offs (ensuring defensible economic assessment), providing better investment decision tools for predicting performance and deterioration with time, and scheduling and prioritizing maintenance and repairs balanced with the consequences of delays.

Accomplishments in FY 2007 include:

- Reduced potential for loss of life and loss of navigation at navigation locks during high flow conditions by demonstrating wireless display of real time current measurements at lock approaches to towboat captains.
- Increased safety and reduced dredging costs through improved ship simulations for optimum design of wider channels to accommodate larger vessels.

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS FOR FY 2007

- Evaluated concrete repair technology for cost-effective application to navigation structures with reduced impacts on navigation throughput.
- Released beta version of improved coastal structure condition index tool to assist in risk-based decision making for major rehabilitations.
- Improved barge impact predictions for flexible lock walls using two new engineering methodologies, lowering costs of new locks.
- Unified coastal structures condition assessment through release of a beta version of a revised condition index system that uses global positioning system (GPS) and digital technology for more quantitative measurements.
- Facilitated use of consistent methodologies across Corps Districts for evaluating deep-draft waterway improvements by fielding the deep-draft version of HarborSym, including training through the Deep Draft Center of Expertise.
- Improved capability to model intermodal transportation through time, understanding mode, source and destination switching resulting from changed transportation system attributes, through release of a beta version of a Regional Routing Model.
- Improved ability to evaluate non-structural as well as structural inland waterway improvements by fielding the beta version of Navigation System Simulation Model.
- More accurately predicted shipper response to changes in waterway attributes by users of the Ohio and Mississippi River transportation network through completion of shipper response studies on the Upper Mississippi and Ohio Rivers.
- Developed acoustic technology to measure tension and corrosion in steel tainter gate embedded tendon rods that will reduce maintenance costs by eliminating the unnecessary replacement of the rods (U. S. patent application no. 11/727,644A entitled "Device for Measuring Bulk Stress via Insonification and Method of Use Therefore").
- Improved ability to compute reliability of coastal structures, compute life-cycle costs, optimize section alternatives, and determine asset risk by developing coastal structure life-cycle simulator RMDAMRisk.

- Developed capability to model complex nearshore wave-structure interaction, wave run-up and overtopping, and wave forces on structures in the surf zone with new version of COBRAS, a coupled Boussinesq-Navier-Stokes numerical model.

Flood and Coastal Storm Damage Reduction Research Program

This R&D activity is funded under the Investigations appropriation. As part of its "Flood and Coastal Storm Damage Reduction" mission, the Corps of Engineers is responsible for more than 600 dams, operates over 400 major lakes and reservoirs, maintains 8,500 miles of levees, and has over 100 coastal storm damage reduction and related projects. Flooding that occurs in the United States costs about \$4 billion annually. Despite all efforts, annual damages in the flood plain continue to rise due to continued urban development. In addition, the 2000 census showed that more than 50% of the U.S. population lives within 50 miles of a coast and is vulnerable to dangerous coastal storms and costly flooding. Consequently, over the past several years, federal coastal storm damage reduction expenditures increased to more than \$100 million per year to protect the public and related economic investments.

In managing flood and coastal storm damage reduction projects around the country for the public's safety and benefit, the Corps is challenged to simultaneously optimize additional requirements for navigation, hydropower, water supply, environmental stewardship, and recreation while maintaining sustainable and adaptable watersheds. The Corps must have the most advanced capability to conduct risk-based assessments of alternative project designs and operational scenarios; those capabilities must be robust, reliable, and comprehensive; and they must lead to sustainable solutions.

R&D delivers efficient and effective capabilities to plan, design, construct, operate, maintain, and improve water resources projects in all climates and settings, from warm to ice-affected, and from inland to coastal. Capabilities to prevent loss of life, minimize property damage, and reduce the life-cycle costs of projects are critical. Capabilities include advanced processes and design models, economic models and decision support software, infrastructure condition and risk assessment tools, infrastructure design guidance, innovative operation and maintenance technologies, flood-alert instrumentation, expedient emergency response

capabilities, and the capability to take advantage of new real-time data sources (e.g. precipitation radar) to accurately forecast real-time flow and stages.

Accomplishments in FY 2007 include:

- Increased dam safety risk assessment technologies and improved determination of dam performance probabilities.
- Improved the Dam Portfolio Risk Assessment Screening Software Tool being used to prioritize dam safety investments until full Portfolio Risk Assessment Process and Tools are fielded in FY 2010.
- Improved the Corps' capability to support rapid emergency response assessments of inland and coastal flood control structures by integrating geophysical, remote sensing, and geospatial applications with data collection instrumentation.
- Released the IWR Planning Suite decision support software, a decision support tool for formulating alternative plans and evaluating ecosystem restoration alternatives.
- Improved analysis methods for flood damage reduction by identifying key social factors, data sources, and methods for use in project evaluation, and demonstrated the effectiveness of a combined social and geographic vulnerability assessment technique.
- Improved reliability of water management project design and operations by providing outlet structure computational methods and soil moisture parameter adjustment capabilities for real-time forecasting of complex water allocation systems.
- Developed guidance for use of ice-related parameters that will improve design of ice-affected river channel restoration projects.
- Improved the Corps' methodology for statistical analyses in flow-frequency curve computations.
- Improved visualization tools that provide a view of velocity, ice thickness, and flooding depths and boundaries.
- Initiated the Snow Information Management System development that will provide a standardized approach to collecting, processing, maintaining, displaying, and utilizing snow data for applications such as estimating total watershed snow water equivalent volumes.
- Improved methods for determining uncertainties related to graphical frequency

analyses that impact the computation of expected annual damages and project performance including determining certifiable levee heights.

- Enhanced the Corps' capability to implement risk-based design and formulation of shore protection projects by release of operational guidelines and beta version of model to estimate cost and benefits and associated risk and uncertainty of alternatives.
- Conducted joint U.S. and European Union workshop on collaborative flood risk management research and development.

Ecosystem Management and Restoration Research Program

This R&D activity is funded under the Investigations appropriation. Ecosystem Restoration is a growing focus of the Corps' Civil Works program, ranging from large-scale projects such as the Everglades to smaller, localized ecosystem restoration projects. In addition, the Corps carries out environmental and natural resource management and restoration activities on more than 11 million acres of land and water resources. The goal of this R&D is to provide Corps field personnel with cost-effective/innovative technologies for project planning, design, construction, O&M, and regulatory activities. Product lines include: Environmental Benefits Analysis, Ecosystem Functional Evaluation, Ecosystem Restoration, and Environmental Stewardship and Management. Products are concise, how-to guidance documents that provide rapid/low-cost technologies and methods for high-priority field needs. This technology is critical to the success of the Corps' Continuing Authorities Program (CAP) as well as larger Investigations-funded projects.

Accomplishments in FY 2007 include:

- Developed a spatially explicit decision support system for prioritizing wetland restoration areas.
- Developed guidance for implementing avian inventory and monitoring efforts on Corps projects.
- Provided a library of habitat models to evaluate benefits of aquatic restoration projects on fish.
- Evaluated the application of conceptual models to ecosystem restoration.

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS FOR FY 2007

- Developed quantitative and qualitative measurement of riparian and in-stream functions.
- Initiated development of a suite of tools for improved natural resource inventories on Corps lands and waters.
- Provided techniques for restoration of delta streams, including a case history and a conceptual model.

System-Wide Water Resources Research Program

This R&D activity is funded under the Investigations appropriation. The goal of the System-Wide Water Resources research area is to support all business lines of the Corps of Engineers and its partners by providing the capabilities to balance human development activities with the natural system in a sustainable manner through regional management and restoration of the Nation's water resources over broad temporal and spatial scales.

The capabilities provided herein include science-based water resource management methodologies, implementation guidance, computational frameworks and technologies, and decision support. These capabilities are being built from sound scientific principles reflecting an improved understanding of inter-relationships among key system attributes such as hydrology, geomorphology, chemistry, ecology, and socioeconomic. Capabilities are being served via a seamless, integrated architecture allowing projects to be considered at multiple scales during project planning, design, construction, and operation and maintenance.

Accomplishments in FY 2007 include:

- Delivered eight watershed assessment tools to the field (over 20 Corps applications and Corps-wide use of the watershed notebook).
- Delivered four riverine hydrodynamic and ecological assessment tools to the field (17 Corps applications and extensive dam break analysis).
- Delivered three estuarine and coastal hydrodynamic and morphology assessment models (15 applications including post-hurricane assessments).
- Delivered three ecological systems models for large-scale applications.
- Delivered six data/knowledge management tools with Corps-wide applications, data visualization capabilities, and data tools for Corps partners.
- Advanced the computational structure of both one-dimensional and multi-dimensional hydrology and hydraulics models to accommodate sources and sinks of water for more accurate water budget estimates and applied to large and complex watershed studies and reduced run times by as much as 30% for complex hydrodynamic modeling.
- Improved parameter estimation tools for reducing uncertainty in hydrology and hydraulics models for improved forecasting.
- Improved three-dimensional groundwater and surface water interactions for wetting and drying for more accurate representation of physical and biological response to water level fluctuations in riverine, reservoir, and estuarine environments.
- Beta tested three-dimensional hydrodynamic modeling of salinity using an adaptive hydraulics grid for more accurate predictions of water movement and material transport in estuarine and coastal environments.
- Developed improved sediment transport kinetics for one-, two-, and three-dimensional hydraulic models for more accurate estimates of sediment movement in rivers and estuaries.
- Refined linkages among multi-dimensional hydrodynamic models for a systems approach to sediment and nutrient transport and fate assessments.
- Refined linkages among multi-dimensional hydrodynamic models and selected ecological models for habitat and operational assessments.
- Advanced ecological model applications for fish passage, trophic evaluations, and restoration alternative analysis using linked hydrodynamic, agent-based, and trophic response models.
- Developed innovative approaches (e.g., combined hyperspectral, thermal, and visual) remote sensing technologies for ecosystem assessment and monitoring and applied to evaluation of ecosystem impacts associated with hurricanes.
- Developed innovative spatial monitoring/assessment technologies using isotopes and geochemical markers for sediment and nutrient fate and effects applications and applied to assessment of impacts of freshwater diversions on

- biological communities.
- Developed alpha application of assessment and forecasting technologies for decision making in watershed management, river restoration activities, and implementation of coastal restoration projects.
 - Developed and applied data management retrieval and standard methods for large scale assessments associated with hurricane impacts and Everglades restoration activities.
 - Demonstrated three-dimensional hydraulic modeling for surface and groundwater interactions for complex systems such as South Florida (Everglades).
 - Demonstrated two-dimensional hydrologic modeling with nutrient and sediment transport capabilities for complex watershed with surface and subsurface drainages typical of the upper Mid-West (e.g., Minnesota River Basin).
 - Demonstrated coupled biological habitat and hydrologic models for assessment of water resource management activities on flora and fauna in rivers, reservoir, and estuarine systems.

Urban Flood Damage Reduction and Channel Restoration Development and Demonstration Program for Arid and Semi-Arid Regions, New Mexico and Nevada

This R&D activity is funded under the Investigations appropriation as a congressional add. The program purpose is to develop and demonstrate innovative techniques to address severe urban flooding and channel restoration issues unique to the arid and semi-arid regions of the southwestern United States. The program is a collaborative effort between the Corps of Engineers and the Desert Research Institute of the University of Nevada. The topics have been selected with input from Corps field personnel, along with state and local stakeholders.

Accomplishments in FY 2007 include:

- A 1-day technical program was held at the 11th Arid Regions Conference of the Association of State Floodplain Managers (ASFPM). Presentations were made on program work units. An audience of approximately 50 people participated, with opportunities to provide feedback and to suggest additional arid-regions topics to

include in the program. The session was open to all conference attendees, and included representatives from flood control districts, state and federal agencies, and other Corps personnel. Presentations and fact sheets for each project are being reviewed by District personnel prior to being posted on the Web.

- Prepared a draft report that summarized the existing state of the science, identifies knowledge gaps, and discussed research directions on wildfire effects on watershed hydrology. The report material was also presented at the 11th Arid Regions Conference of ASFPM (Breckenridge, CO, Sept 07).
- Developed a simple spreadsheet tool to assist practitioners in estimating resistance coefficients for complex stream systems in arid regions. The tool incorporates multiple predictors for grain, form, and vegetation roughness, and provides multiple algorithms for compositing. Simple statistical outputs aid designers in selecting "most likely" values for resistance, as well as ranges of likely values for situations requiring sensitivity analyses or estimates of uncertainty.
- Issued a technical report on the computation of increased stages at lateral inflows. The conclusions were based on the results of analytical methods, numerical modeling, and physical modeling. This work will extend Corps guidance to cover confluences where the tributary flow is small compared with the main channel, and where lateral inflows occur. These situations are common in urban watersheds throughout the southwestern United States.
- Research concluded that previously-developed bed load equations for sediment transport mechanisms were appropriate to use in the Las Vegas wash. In addition, a new equation was also developed for predicting bed load transport in the wash. The results have been published in the *Journal of Hydraulic Research*.

Southwest Urban Flood Damage Program, New Mexico

This R&D activity is funded under the Investigations appropriation as a congressional add. The program purpose is to develop and demonstrate innovative techniques to address severe urban

flooding and channel restoration issues, and is a collaborative effort with the Corps of Engineers, University of New Mexico (UNM), and Sandia National Laboratories.

Accomplishments in FY 2007 include:

- A 1-day technical program was held at the 11th Arid Regions Conference of the ASFPM, where presentations were made on program work units. An audience of approximately 50 people participated, with opportunities to provide feedback and to suggest additional arid-regions topics to include in the program. The session was open to all conference attendees, and included representatives from flood control districts, state and federal agencies, and other Corps personnel. Presentations and fact sheets for each project are being reviewed by District personnel prior to being posted on the Web.
- Conducted a seminar class at the University of New Mexico focused on the state of the knowledge of flooding issues associated with the Middle Rio Grande. This provided an opportunity for outside speakers as well as a collaborative forum for the different Rio Grande projects taking place at UNM. Fifteen speakers participated and, average attendance was thirty.

Aquatic Plant Control Research Program

This R&D program is funded out of the Construction appropriation. The Aquatic Plant Control Research Program (APCRP) is the Nation's only federally authorized research program providing the technology to manage invasive aquatic plant species. Millions of acres nationwide are now infested with invasive aquatic plants that create water resource problems. These plants when imported as exotic, have few natural enemies, and rapidly out-compete native aquatic plants. Eurasian watermilfoil, hydrilla, waterlettuce, and other invasive species continue to propagate from local infestations. Many of these plants are interfering with navigation, flood control, hydropower production, water quality conditions, and waterborne recreational uses. They have a very low value to fish and wildlife and contribute significantly to overall environmental degradation. New colonies of invasive aquatic plants continue to be found, including hydrilla in the Potomac River, Chesapeake Bay, the upper Midwest, and the Northwest; Eurasian watermilfoil in the upper

Midwest and Northwest; giant salvinia in Hawaii, Texas, Florida, and other southeastern states; and water chestnut in New York and New England. In addition, hybridization between native and invasive aquatic plant species and the development of herbicide-resistant plant populations have recently been documented and can impact the efficacy of current management practices.

The objective of the APCRP is to develop cost-effective, environmentally compatible aquatic plant control technology, including biological, chemical, ecological, and integrated control methods. APCRP research is producing information on the growth and ecological requirements of invasive aquatic plants and is producing new biological, chemical, and ecological technologies for their control. Specific information on the biology and ecology of invasive aquatic plants, obtained through research in the APCRP, has greatly improved the efficacy and diversity of management options, while minimizing adverse effects on the environment.

Accomplishments in FY 2007 include:

- Documented changes in plant response to aquatic herbicides.
- Developed herbicide resistance management strategies.
- Developed assays to identify hybrid and resistant plant populations.
- Identified environmental factors that influence herbicide efficacy.
- Developed species-selective management capabilities.
- Established techniques for integrating chemicals and pathogens to improve plant control.
- Provided guidance on the use of herbicide combinations.
- Provided guidance for using selective chemical control strategies where Threatened and Endangered species are of concern.
- Developed new species-selective active ingredients.
- Identified overwintering behavior of the hydrilla leaf-mining flies.
- Developed and refined mass-rearing strategies for insect biocontrol agents of water lettuce and giant salvinia.
- Developed and tested beta version of a revegetation site selection model to aid in the selection of sites best suited for aquatic plant revegetation.

U.S. ARMY ENGINEER RESEARCH AND DEVELOPMENT CENTER

- Evaluated effects of plant nutritional composition on the growth and reproduction of insect and pathogen biological control agents.
- Documented the relationship of Eurasian watermilfoil phenology to fungal endophyte infection.
- Evaluated storage life and effectiveness of dry fungal formulations on hydrilla.
- Developed PDA (hand-held personal digital assistant) version of the Aquatic Plant Information System.
- Documented relationships between hydrilla dispersal in the presence of native plant assemblages with and without the presence of insect herbivores.
- Documented impact of biocontrol agents on monoecious and resistant hydrilla.
- Participated in studies to determine genetic makeup of hydrilla around the world.
- Reared and released over 3.7 million leaf-mining flies for the management of hydrilla in Florida, Georgia, and Texas.
- Provided the South African government with over 100,000 leafing-mining flies and direct technical assistance for hydrilla management.
- Identified effects of nutrients and nutrient depletion on aquatic plant infestations.
- Determined temperature, water chemistry, nutrient, and pH requirements for growth of giant salvinia.
- Conducted comparative analyses of aquatic plant assessment methodologies.
- Developed methodologies for propagating desirable native aquatic plants to enhance aquatic ecosystem restoration efforts.
- Developed best management practices for establishment of preferred aquatic plant species.
- Evaluated phenological differences between two growth forms of hydrilla as applies to current management practices.

Aquatic Nuisance Species Research Program

The Aquatic Nuisance Species (ANS) Research Program is an expansion of the Zebra Mussel Research Program. Funded under the Operations and Maintenance appropriation, this expanded program addresses all invasive aquatic animal species. Invasive species in general cost the public over \$137 billion annually. Zebra mussels alone cost the public over \$1 billion annually and they have now been

discovered in lakes and rivers west of the 100th meridian. It is estimated that over 100 nuisance species are introduced into U.S. waters annually. Many of these species have the potential to impact facility operations - as well as threaten valued native species diversity. The Corps is responsible for the O&M of water resource projects on navigable waters and the associated resources. More effective, inexpensive methods of prevention and control of aquatic nuisance species must be developed to reduce impacts to public facilities and protect valuable natural resources.

Prevention methodology focusing on dispersal barrier technology will be investigated. Control strategies are being developed for navigation structures; hydropower and other utilities; vessels and dredges; and water treatment, irrigation, and other water control structures. Methods to reduce invasive species impacts to Threatened and Endangered species and restore natural habitat will be investigated. Numerous dredged material disposal areas in the Atlantic, Gulf coast, and Great Lakes region have mosquito abatement programs. Due to the introduction of the West Nile Virus, local communities want greater assurances that mosquito populations at Corps disposal sites are controlled to the maximum extent practicable. Following the introduction of the northern snakehead fish, a number of Corps reservoir projects have had to take interdiction measures to prevent introduction of the fish.

Accomplishments in FY 2007 include:

- Evaluated potential control measures for Asian carp in the Upper Mississippi River.
- Evaluated potential new chemical compounds to control harmful algal blooms.
- Investigated life stage sensitivity analysis to chemical control measures for ANS.
- Developed ANS assessment technologies for early detection, threat level, monitoring strategies, management protocols, and exclusion protocols.
- Developed Internet/computer-based information system containing ANS species profiles for quick access by Corps project managers.

Coastal Inlets Research Program

The Coastal Inlets Research Program (CIRP) is a R&D program funded under the Operations and

Maintenance appropriation. Records demonstrate that the Corps will expend an estimated \$15 to \$20 billion over the next 25 years at the more than 150 coastal inlets with existing major federal navigation projects to maintain, modify, and create navigation channels and structures, and to mitigate damages to adjacent beaches. In addition, the national “2020” plan for deeper and wider channels to accommodate the next class of vessels brings great uncertainty in prediction of maintenance requirements. Political, engineering, and demographic factors may increase these costs. The public perception, right or wrong, that federal activities at inlets cause adverse response at adjacent beaches may require additional, expensive mitigation. Public sensitivity to the common maintenance practice where dredged material is placed in offshore disposal areas may result in requirements for more nearshore placement of maintenance materials to benefit adjacent beaches. Inlets are the primary conduits for the transport of environmental constituents between bays and the open ocean, and the Corps may be constrained from performing present activities unless the Corps can make accurate predictions of inlet response, and thus environmental response, to such activities. As inlet behavior becomes better understood through the R&D, reliable tools for management of inlets for navigation projects, such as models and empirical relationships, are becoming available for inlet O&M. These new tools will lead to more efficient, cost-effective designs and reduce O&M requirements and, consequently, costs.

Accomplishments in FY 2007 include the following:

- Developed new jetty designs and criteria for reducing dredging maintenance cost.
- Produced advanced Boussinesq numerical model for calculation of waves at around and through structures. Presented two workshops to Districts.
- Produced integrated Coastal Modeling System for calculating sediment transport, channel infilling, and morphology change under all typical hydrodynamic forcing at inlets. Presented workshop to Districts.
- Developed new barrier island breaching modeling for analyzing breaches that are tending to occur near older jetties.
- Published and implemented state-of-the-art sediment transport formulas that provide integrated calculation through all hydrodynamic regimes at inlets (rivers, tide, waves, waves plus current).

- Prepared guidance documents on strategies to reduce navigation channel infilling.
- Conducted morphologic assessment and provided engineering guidance for stability of multiple inlets connecting to the same bay, treating the bay system as a hydrodynamic and sediment-sharing system.
- Developed a numerical tool box for estimating infra-gravity or very long waves that can cause dangerous oscillations to vessels moored at harbors.
- Published guidance on sand waves that may appear in navigation channels.
- Applied modeling technology to develop justifications for mining of inlet ebb shoals as a source of bypassing material to the down-drift beaches.

Dredging Operations and Environmental Research Program

This R&D program is funded under the Operations and Maintenance appropriation. The Dredging Operations and Environmental Research (DOER) Program is an integral and highly beneficial component of the Corps’ navigation dredging and environmental protection missions. Dredging and disposal must be accomplished within a climate of increased dredging workload, fewer placement sites, environmental constraints, and decreasing fiscal and manpower resources. A major challenge is balancing environmental protection with critical economic needs while accomplishing dredging activities. The program has validated innovative technologies for high-profile contaminants and developed risk-based assessment methods that will significantly reduce testing costs at virtually all harbors. Methods for reclamation and beneficial use of dredged material will contribute to sustainable management of disposal sites, providing both economic and environmental benefits.

Major focus areas of DOER include dredged material management, environmental resource protection, operations technologies, and risk science. Accomplishments in FY 2007 are listed below by research focus area.

Dredged Material Management:

- Surface-water Modeling System Version 10 was upgraded to include dredging toolbox, which includes methods for data transfer,

model setup, model execution, and analysis of results.

- Developed the Particle Tracking Model (PTM), Version 2.0. PTM is a Lagrangian particle tracking model that monitors the far field fate of dredged material. Features added in Version 2.0 include more accurate methods for determining pathways, advanced cohesive sediment capabilities, and additional verification and test case validation.
- Developed the LTFATE Version 2.0, a new LTFATE sediment transport model for dredged material mound dispersion. Version 2.0 includes user-specified wave fields, three-dimensional hydrodynamics and sediment transport, three-dimensional stratified sediment bed, multiple grain sizes, bed and suspended load transport, and cohesive sediment processes.
- Developed the Particle Imaging Camera System, an in situ system to provide rapid imaging of particles in dredge plumes. A prototype system was developed and adapted for field deployments.
- Completed development of process-based models for loss rates during these dredging methods (cutterhead, hopper, and auger dredges). Collected additional field data for model verification for hopper dredge with overflow.

Environmental Resource Protection:

- Completed formulation of a risk-informed decision framework as a basis for setting environmental windows for dredging projects, allowing consideration of socio-political factors and stakeholder values in addition to technical input. Submitted a paper describing the framework to a peer-reviewed scientific journal.
- Completed design and construction of a large capacity Brett-type swim tunnel for expansion of research into factors that govern risk of entrainment of endangered species by hydraulic dredges.
- Completed preliminary configuration of a GIS-based tool using eCoastal as a platform for assessing potential impacts of navigation projects on foraging habitat of protected gulf sturgeon. The tool will assist planners in avoiding conflicts and proactively investing in studies to minimize impacts.

- Developed a research plan to address critical Threatened and Endangered bird habitat management issues that arise in conjunction with beach nourishment projects.
- Prepared guidance on a strategy for sustainable management of confined disposal facilities (CDFs). The final document describes options for beneficial re-use of sediments placed in CDFs with a goal of reclamation and restoration of placement capacity.
- Completed analyses of historical data on risk factors associated with incidental take of sea turtles to support expansion of existing environmental windows.
- Completed field evaluations of hopper dredge overflow anti-turbidity valve effectiveness in reducing dimensions of suspended sediment plumes. Study results have major implications for determining means to minimize risk of exposure and detrimental effects on a variety of protected species.

Operations Technologies:

- Completed hydrocyclone optimization analysis to separate and isolate contaminated sediment fractions from dredged material, thereby reducing disposal costs.
- Demonstrated a Silent Inspector automated cutterhead dredge monitoring system on contractor dredge.
- Completed laboratory and field evaluations of fluid mud and dredging residuals survey systems for investigation into feasibility of implementation of a Corps-wide navigable depth policy and to improve capability to characterize dredging projects with unconsolidated contaminated sediment bottoms.
- Completed eGIS application requirements and preliminary design for developing and reporting calculations of key performance measures related to navigation channel reliability.
- Completed final draft of Engineer Manual 1110-2-5025 (Dredging and Dredged Material Management) by updating and merging the three primary Corps dredging engineer manuals (Dredging and Dredged Material Disposal (1983), Beneficial Uses of Dredged Material (1986), and Confined Disposal of Dredged Material (1987)), along

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS FOR FY 2007

with the addition of an entirely new open water dredged material placement chapter.

for many projects. The Corps also contributes through this program to the Nation's Integrated Ocean Observing System (IOOS).

Risk:

- Completed a detailed review and engineering analysis of promising contaminated sediment treatment technologies to evaluate the costs and benefits relevant to the navigation program.
- Enhanced DREDGE model source term and users guidance to provide more reliable estimates of sediment resuspension rates and exposure estimates for risk assessment.
- Upgraded RECOVERY and CAP models to provide more accurate predictions of contaminant flux from sediment to the overlying water. Such models are essential design tools for evaluating confined aquatic disposal options for contaminated dredged material.
- Developed experimental methods for quantifying the contribution of biological disturbance of the sediment column (i.e., bioturbation) to contaminant flux through sediment caps. Bioturbation is a major source of uncertainty in cap design.
- Completed experiments to evaluate use of solid-phase microextraction as a much less costly and time-consuming experimental method for predicting porewater concentration and the bioavailability of polychlorinated biphenyls in sediments.

Other Programs

Within the Investigations, Operations and Maintenance, and Construction appropriations, the ERDC conducts technical support efforts that consist of activities such as demonstrations, mapping, data collection and management, studies, and technology transfer and support. Significant activities in this area of effort are described below.

Coastal Field Data Collection

The Coastal Field Data Collection Program is a nationwide program designed to measure, analyze, and assemble information required to accomplish the Corps' mission in coastal navigation and storm damage reduction. It is designed to collect non-project-specific data, such as regional data necessary

Significant accomplishments in FY 2007 include:

- Completed modeling of 24 years of historic Pacific Ocean waves and made them available on the Internet. The modeled wave data provide high-quality detailed coastal wave information for project planning and coastal management. New wave and wind information products and enhanced download features were added to the Web site. In collaboration with the National Oceanic and Atmospheric Administration (NOAA), wave hindcasting procedures for the Pacific were updated to the latest version of NOAA's Wavewatch III numerical wave model, and model output now includes spectral parameter products.
- Led the development of a National Operational Wave Observation Plan for the IOOS. The plan comprehensively addresses all aspects of a measurement program including spatial and temporal coverage and the accuracy requirements to serve the broadest range of wave information users. This is a significant document that builds on the limited wave observation network that exists today.
- Added three new directional wave measurement stations as part of the Coastal Data Information Program (CDIP): Tampa/St. Petersburg FL; the San Francisco Bay, CA; and Kaunapala, Lanai, HI. All sites were added in collaboration with multiple federal agencies and local sponsors. CDIP is a collaborative effort with the State of California and the Scripps Institution of Oceanography.
- Mapped 120 miles of coastal Southern California twice in FY 2007 using airborne LIDAR (Light Detection and Ranging), continuing a unique effort that began in 2002. The mapping provided a new understanding of a previously undocumented alongshore variation that is not predicted with existing coastal sediment/evolution models. Based on the LIDAR mapping data and estimates of sediment transport based on wave observations, these studies advanced regional sediment management concepts through a new nearshore sediment budget formulation.

U.S. ARMY ENGINEER RESEARCH AND DEVELOPMENT CENTER

- In collaboration with the MORPHOS beach modeling activity under the System-Wide Water Resources Program, added real-time wave forecasting for North Carolina to ERDC's Field Research Facility's (FRF) website. This is a first step to evaluating the performance of a number of coastal models. The FRF Web site was revamped and new wave analysis products added. These changes provide data users with better access and more comprehensive analysis tools.
- Under the Pacific Island Land-Ocean Typhoon experiment that is studying storm surges on islands caused by typhoons: (1) added LauLau, Saipan, to the cross-reef measurement locations; (2) continued 100% data record (began in 2004) on the Guam reef; (3) captured wave, water level, and meteorological data during passage of typhoon Man-yi; and (4) continued 100% data record at Mokuleia on Oahu, HI. The University of Hawaii is lead collaborator at the Guam and Hawaii sites.
- Developed the TWAVE (Tropical storm and WAVE) modeling suite to estimate winds, waves, and surge on reefs for use by emergency managers as well as others interested in coastal hazard forecast and response.
- Deployed a new interferometric survey system for the Corps that provides high-resolution side-scan sonar images in shallow water. The 100% bottom coverage leads to three-dimensional maps that greatly enhance the analysis of shallow coastal changes.

Remote Sensing/Geographic Information System (GIS) Center

The Remote Sensing/GIS Center is the Corps' Center of Expertise for Civil Works remote sensing and GIS technologies, providing mission-essential support to the Corps. Through centralized management of this function, the Center provides cost-effective support through technology transfer and applications development for Corps mission responsibilities in all business practice areas: navigation, flood and coastal storm damage reduction, hydropower, regulatory, environment, emergency management, recreation, water supply, and work for others. An enterprise GIS approach is an essential component of this support. Continuing interaction with other researchers and practitioners throughout the Corps, government, the private sector,

and academia ensures that state-of-the-art and state-of-the-practice knowledge of evolving trends that are important are available for the Corps and that duplication of effort is avoided.

The Remote Sensing/GIS Center develops approaches for the integration of data from the disparate sources necessary for system-wide land and water resources management including: regional sediment management, regional water management, ecosystem processes and assessment; basin studies; water control; support to emergency management; and compliance with the attendant environmental regulations and related policies. The Center maintains cognizance of state-of-the-art sensors, data collection, analysis, and storage systems; commercial software; and bridging software that integrates these and operational technologies into Corps Division, District, and other agencies activities.

Technology is transferred through telephone and short, no-cost assistance to the field. The existence of the Center ensures that the necessary support can be rapidly directed toward solving operational problems that require specialized expertise. The PROSPECT training program in remote sensing and GIS, managed by Center staff, provides another avenue for the transfer of knowledge to those who are, or soon will be, using these technologies. Training is also conducted in the field through workshops, conferences, and distance learning. White papers, pilot projects, publications (including Engineer Technical Letters, Circulars, and Manuals), and the Internet are also used to transfer procedures and lessons learned to end users.

Accomplishments in FY 2007 include:

- As the Center of Expertise, served as key resource and technology point of contact for the Corps of Engineers for Civil Works remote sensing and GIS.
- Provided guidance and technical support to the Corps' Geospatial Community of Practice (CoP) and provided leadership to the remote sensing, hydrology and hydraulics, and emergency sub-CoPs.
- Continued technology transfer through training courses, briefings, development of distance learning, technical papers, technical demonstrations, pilot programs, and conferences.
- Supported one-stop service requests from Corps Districts and Divisions.

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS FOR FY 2007

- Assisted with geospatial emergency management support during disasters and supported Interagency Performance Evaluation Taskforce (Hurricane Katrina) efforts.
- Provided leadership and technical support to strategic and enterprise USACE geospatial initiatives: National Levee Database deployment; Corps Project Notebook; Corps Map; DISDI Portal; Corps Water Management System; Geospatial Operations and Maintenance Business Interlink developer; Emergency Management, Remote Sensing, GIS, and Modeling Group; and Hydrology and Hydraulics modeling software development and support team member.
- Sponsored and participated in program development of national and international remote sensing and GIS conferences.
- Updated the PROSPECT Introductory and Intermediate GIS courses.
- Participated in the technical execution of the Missouri River Recovery Program.
- Provided technical support to Corps District offices for the development of implementation plans for geospatial data management including development of enterprise geospatial data approaches.
- Provided ad hoc mapping functions for HQUSACE.
- Conducted worldwide mapping and charting missions in support of the Joint Center partners, including the U.S. Great Lakes and New England regions, Hawaii, Guam, Saipan, and the Philippines.
- Acquired a third post-Katrina topographic LIDAR and hyperspectral imagery data set in the New Orleans vicinity for development of change analysis routines fusing LIDAR and spectral imagery.
- Developed new shoreline classification tool that produces data and formats compatible with NOAA's and the Corps' classification schemes. This expands the the Joint Center's shoreline vector product to include shoreline classification.
- Produced numerous technical papers, such as "CHARTS-enabled data fusion for coastal zone characterization," which was presented at the Coastal Sediments 2007 Conference.
- Delivered FY 2006 National Coastal Mapping Program data to the Lakes & River's Division for Lake Erie, Lake Huron, and the Detroit River.
- As of Dec 2007, over 2,893 individual downloads of the Corps' National Coastal Mapping Program LIDAR data have been made, totaling 190 gigabytes. This is accomplished through the NOAA Coastal Services Center's LIDAR dissemination system.
- Completed coastal mapping operations in New England for the North Atlantic Division with topographic and bathymetric LIDAR and RGB imagery.
- Completed Eighth Annual Coastal Mapping & Charting Technical Workshop in Seattle, WA, to coordinate with federal, state, industry, academia and international experts in related technologies. The workshop included 22 technical presentations over 2 days.
- Completed the second year of a 3-year National Ocean Partnership Program initiative to develop data fusion tools to bring topographic and hydrographic LIDAR and hyperspectral imagery together to improve our ability to classify and characterize land use, nearshore bottom types, and environmental resources.
- Completed the Coastal Zone Mapping and Imaging LIDAR (CZMIL) conceptual design for an integrated airborne, data processing, and product generation system.

Joint Airborne LIDAR Bathymetry Technical Center of Expertise

The Joint Airborne LIDAR Bathymetry Technical Center of Expertise is a Joint Center with the Corps of Engineers, the Naval Meteorology and Oceanography Command's Naval Oceanographic Office, and NOAA's National Ocean Service. The Joint Center's mission is to conduct airborne coastal mapping and charting in support of the partners and perform research and development to evolve capabilities and supporting technologies. Through the Joint Center, the Corps implements its National Coastal Mapping Program. The program provides regional coastal data to measure and monitor engineering, environmental, and economic conditions along the U.S. coast, supporting both regional sediment management and individual project operations and maintenance.

Accomplishments in FY 2007 include:

CZMIL is the third-generation system being developed through the Joint Center partnership.

- Competed and awarded a new 5-year Joint Center Technical Support contract, which includes worldwide operation of the CHARTS system.

Automated Information Systems Support - Computer Aided Design and Building Information Modeling (CAD/BIM) Technology Center

This effort provides technical support to engineers and scientists utilizing CAD, BIM, GIS, and facility management technologies in the planning, design, construction, and operation and maintenance of Corps projects. The Center includes participation by the Army, Navy, and Air Force to reduce duplication of effort between the three services in the management of CAD/BIM technology for facilities and environmental engineering. The Center is tasked to set standards; coordinate the use of CAD/BIM systems; promote system integration; support centralized acquisition; and provide assistance for the installation, training, operation, and maintenance of CAD/BIM systems within the DoD facilities and environmental communities, including the Corps Districts. All Corps Districts that use CAD, GIS, and BIM in mapping, planning, real estate, design, construction, operations, maintenance, and homeland defense and readiness benefit from the Center's efforts.

Accomplishments in FY 2007 include:

- Developed BIM Road Map document for HQUSACE to define vision and milestones for successful BIM implementation.
- Published Real Estate Guidebook defining scanning techniques for CAD data storage.
- Established collaborative engineering oversight group (ProjectWise Steering Committee) to coordinate rollout of CAD/BIM applications across the Corps.
- Developed ProjectWise PCM Version 2.0 to standardize ProjectWise data structure across Corps.
- Developed and conducted BIM Managers Training for the newly designated BIM Managers within the Corps' District offices.
- Completed Release 3.0 of the A/E/C CAD Standard used across the design industry to provide the Corps with consistent CAD submittals.

Dredging Operations Technical Support Program

Within the Operations and Maintenance appropriation, the Dredging Operations Technical Support (DOTS) Program fosters a "one-door-to-the-Corps" concept by providing comprehensive and interdisciplinary technology transfer, technology demonstrations, and training essential to all stakeholders involved in navigation projects. The DOTS Program is managed as a centralized program to maximize cost effectiveness while facilitating consistent implementation of National policies and laws pertaining to navigation. The program emphasizes rapid applications of state-of-the-art technology and research results to problems identified by field offices. Maintenance of the Nation's navigation infrastructure requires compliance with numerous environmental statutes and Presidential Executive Orders. These requirements and new emerging environmental concerns necessitate ready access to advances in scientific knowledge to avoid uncertainties in administration of the Corps' navigational dredging program. The DOTS Program's Web-based and topical expert networking capabilities provide access to extensive, up-to-date, technically defensible databases, predictive models, and tools that enable rapid, proactive responses to emerging technical issues. This access fosters networking and solutions to common problems confronting the navigation and dredging communities. Short-term, quick-turnaround technical efforts that address problematic issues encountered during maintenance and operation of navigable waterways and infrastructure are the foundation of the DOTS Program. Demonstration of new, innovative techniques with potentially high returns on investment for management of Corps navigation projects is another important DOTS function. By disseminating knowledge of new R&D products to field offices constrained by staff reductions, the DOTS Program will continue to perform a critical technology transfer role in support of all O&M navigation projects.

Accomplishments in FY 2007 include:

- Provided numerous technical responses to requests for assistance from field offices, including the Chicago, Detroit, Buffalo, New England, New York, Baltimore, Jacksonville, Mobile, New Orleans, Memphis, San Francisco, and Portland Districts. Responses covered diverse issues, including oil spill response, concerns for microbial pathogens in dredged material, mosquito controls in CDFs, beneficial use of

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS FOR FY 2007

dredged material for bird habitat construction conflicts with airport safety assessments, volatilization of contaminants, open-water placement of dredged material, fish spawning habitat protection, and equipment selection for turbidity controls.

- Performed mandated reporting and coordination with the Environmental Protection Agency (EPA) and the International Maritime Organization in compliance with the 1972 London Convention.
- Conducted several small dredged material management training seminars for regional stakeholder groups. Updated plans for a major training seminar/workshop to be held in the new fiscal year. New topics addressing changing technology needs and solutions have been incorporated into the next training seminar agenda. Renewed training efforts will expand upon the cumulative 5,000 personnel trained by DOTS since 1991.
- Continued expansion of Web-based tools used by field offices to reconcile and manage incidental takes of Threatened and Endangered species across individual District and Division boundaries.
- Refined the DOTS-sponsored Web-based O&M Project Endangered Species Act cost compliance reporting system. This tool has become the Corps' standard for generating required annual reports and facilitated coordination with the Fish and Wildlife Service.
- Continued support of collaborative efforts with the American Bird Conservancy to resolve potential conflicts between O&M projects and bird habitat conservation. Significant progress was made in high-priority areas, including interior least tern and coastal piping plover protection initiatives.
- Fostered improved methodologies for remediation of contaminated sediments via the Center for Contaminated Sediments. Treatment and handling of residuals following cleanup dredging continues to be a priority topic as well as applications of Multi-Criteria Decision Analysis methodologies.
- Continued to update content of Web-based databases and tools that represent critical aids for successful implementation of

guidance contained in Corps/EPA dredged material testing manuals.

Inland Waterway Navigation Charts

This effort provides the Corps' Electronic Navigational Chart data for all inland waterways and other federal navigation channels maintained by the Corps. On inland waterways, the Corps collects accurate survey and mapping data in support of waterway maintenance and construction activities, which is also used to produce Inland Electronic Navigation Charts (IENC) that are available to users of the waterways. When combined with the commercial chart systems, the IENCs greatly improve the safety and efficiency of navigation. Such capability allows safe navigation through bridge openings during fog and other bad weather conditions as well as during heavy traffic situations, and provides an accurate display for other systems such as radar and Automatic Identification Systems. The IENCs use the S-57 international data format, which is readily compatible with commercial systems and enables proper use onboard marine vessels. The IENCs are also consistent with electronic chart products produced by NOAA, which enables seamless transit between shallow and deep water channels. The Corps also coordinates with the Coast Guard for aids to navigation information and collaboration rules for chart carriage by waterway users.

In coastal and Great Lakes areas, the Corps will produce standardized channel conditions chart products that will provide consistent and reliable information to NOAA for chart updates, in accordance with the Water Resources Development Act of 2000, Section 558. Similar channel chart products will be provided to navigation users, and these coastal and Great Lakes channel condition chart products will also follow the S-57 format. The IENC development and publication activities are in accordance with National Transportation Safety Board recommendations to the Corps, and subsequent commitments made by the Chief of Engineers.

Significant accomplishments in FY 2007 include:

- Charts for 5,700 miles of inland waterways were published and maintained, including coverage of the Mississippi and Ohio Rivers and various tributaries.
- Development of charts for 1,800 miles of additional waterways began or was continued.

U.S. ARMY ENGINEER RESEARCH AND DEVELOPMENT CENTER

- IENCs were used on several hundred towboats navigating inland waterways.
- Precise data delineating over 400 coastal deep-draft channels was compiled and used in various chart products.
- Coordination with European Union countries and Russia continued to develop a common international data standard.

Monitoring of Completed Navigation Projects

The purpose of this monitoring program is to identify the best navigation project practices and use them to improve the performance of all navigation projects. Optimizing project performance requires that projects be monitored and evaluated against preconstruction projections and present needs, and that the lessons learned be translated into proactive management guidance for Corps Districts. Information gained from monitoring navigation projects, including changes in sediment transport, water levels, currents, waves, flushing, river flows and other hydraulic phenomena with associated environmental impacts, will be used to verify design expectations, determine benefits, and identify O&M efficiencies. Information collected from monitored navigation projects can improve project performance and optimize opportunities for environmental enhancement. Information collected and analyzed on a national basis documents successful designs, disseminates lessons learned on projects with problems, and provides upgraded field guidance that will help reduce life-cycle costs on a national scale.

Selective and intensive monitoring of Civil Works navigation projects is executed to acquire information to improve project-purpose attainment, design procedures, construction methods, and O&M techniques. Both shallow- and deep-draft navigation projects located in rivers, reservoirs, lakes, estuaries, and the coastal zone are included in this program. Projects that will potentially provide maximum life-cycle cost savings are identified and those that best address high-priority cost savings are selected for monitoring and evaluation. Monitoring plans are developed jointly by Corps Districts and ERDC. Plans consist of either a comprehensive detailed survey to verify post-construction conditions on a one-time basis or a repetitive collection of field data. The intensive data are analyzed and the results compared with the pre-construction predictions to verify or upgrade existing design guidance for minimizing O&M cost and ensuring project benefits. The analyses include structural, topographic,

bathymetric, and hydrodynamic responses and intercomparisons of projects when applicable.

Coordination between the Corps and other federal, state, and local agencies is essential for proper accomplishment of this program. In addition to satisfying Corps' requirements, the data are made available through publications and will be of value to local, state, and other federal agencies tasked with the development and implementation of regional coastal and inland navigation management policies. Results are communicated to member agencies of the Marine Transportation System committees.

Accomplishments in FY 2007 include:

- **Kaumalapau Harbor, HI:** The largest Corps-developed CORE-Loc™ concrete armor units were utilized for breakwater stability. Monitoring construction techniques during rehabilitation placement completed. Baseline monitoring with Ground Based Tripod-LIDAR completed. Developed high-resolution geo-referenced Digital Elevation Model linked to existing benchmark. Conducted multi-beam survey of breakwater sub-aerial surface. Analysis of settlement and movement of armor units was initiated, and numerical model of wave transformation from ocean gage to inner harbor was developed. Toe stability and armor unit concrete strength analysis was initiated. Used remotely operated vehicle with underwater camera to inspect placed core and under-layer stone during construction. Deployed three pressure-sensitive wave gages.
- **John T. Myers Locks and Dam, KY:** Tow damage to wall armor is a major maintenance problem especially at the 1,200-ft locks along Ohio and Upper Mississippi Rivers. Innovative repair techniques were developed and installed at vertical joints near the bullnose. Present design does not provide for wall armor protection at vertical joints. Documented that successful repairs can be made with minimal disruption to river traffic. Developed imaging technique to quantify volumes of wall material lost to spalling and impacts to forecast optimum time for horizontal and vertical wall repairs.
- **John Day Lock and Dam, OR:** Flow deflectors installed to improve fish passage

resulted in hazardous navigation under certain flows. High-velocity surface currents interacted with power house discharge to create cross-currents at downstream entrance to lock. Specialized Acoustic doppler current profiler flow monitoring equipment was installed at several locations around the dam site for current acquisition during spill season (April through October). Data were transmitted to ERDC by satellite dish on gate tower. Analysis of acoustic data was initiated to develop recommendations regarding flow discharge releases to minimize hazards to upstream traffic tows.

- **Great Lakes Armor Stone:** Rapid armor stone deterioration results in high O&M costs and is a significant problem around the Great Lakes under freeze/thaw and wet/dry cycles. Index test stones previously placed on Keweenaw, MI, breakwater were monitored three times for temporal weathering. Conducted quarry investigations, selected, and placed index stones on Cleveland, OH, breakwater. Performed quarry investigations for index stones for Burns Harbor, IN. Initiated laboratory testing of scale effects by using a range of samples, and a range of prototype index stones cut to uniform dimensions, to better estimate stone quality and durability. Conducted lab tests for three different criteria (Corps, American Society for Testing and Materials, and Modified Procedure) to develop enhanced acceptance criteria and specifications.
- **Montgomery Point Lock and Dam (L&D), AR:** The purpose of this L&D is to ensure that the McClennan-Kerr Arkansas River Navigation System remains a viable asset by providing navigation depths in the White River entrance channel at confluence with the Mississippi River. Declining Mississippi River stages have resulted in reduced drafts, lengths, and widths; daylight navigation only; and escort service. A monitoring plan was developed to study aspects of the problem at this unique dam design planned to be used subsequently on the Upper Mississippi River. Study elements include sedimentation, dredging frequency, spillway gate rating, and forces on the crest gates.

- **Periodic Inspections (PI):** Completed inspections at Cleveland, OH, and Burns Harbor, IN, rubble mound and artificial structure units, and prepared technical reports. Reconstructed Coastal Structure and Inlet Database (CSID). Developed coupled Google Earth interface, and transferred technology to field. Continued digitizing historic PI data and loading newly digitized data into CSID. Created CSID Web page, and prepared Coastal and Hydraulic Engineering Technical Note for CSID.

Regional Sediment Management Program

Regional Sediment Management (RSM), coastal and watershed management of the sediment, applies to all Civil Works programs through planning, design, construction, operation, maintenance, restoration, rehabilitation, and regulatory activities. This encourages opportunities for enhancing the O&M of existing projects, the long-term effectiveness of existing projects, and the management of ecosystem resources. In addition, RSM facilitates the regional integration of the Civil Works business programs into the identification and development of new Corps initiatives.

The RSM Program's goals are to link the management of authorized Corps projects with one another, particularly across District/Division boundaries, and to leverage data collection and shoreline management activities with other federal agencies and state and local governments within the limits of a regional watershed system (including uplands, rivers, estuaries and bays, and the coast). The purpose of the Program is to demonstrate short- and long-term cost-savings and increased economic and environmental benefits of maintaining sediments within their regional system, and of using sediments to sustain a balanced environment.

Accomplishments in FY 2007 include:

- The New England District produced a reconnaissance level report evaluating the feasibility of placing O&M dredged material from the Cape Cod Canal onto nine nearby beaches. Results of the report support placement of material on adjacent beaches using existing CAP authorities.
- Initiated development of a framework for the restoration of urban watersheds using the

Darby-Cobbs Watershed in southeastern Pennsylvania as a pilot. This framework will be applicable nationwide to urban watersheds affected by excessive development, habitat degradation, and recurrent flooding.

- The New York District developed a strategy for integrating and balancing National Economic Development and National Ecosystem Restoration (NER) account benefits for storm damage reduction projects. The project finalized two analytical tools and applied to the Fire Island to Montauk Point Reformulation Project to quantify NER benefits.
- Completed initial implementation phase to establish eCoastal GIS platform at the New Orleans District and populate with USACE and Louisiana Department of Natural Resources data. The goal of the project is to develop an operational regional sediment budget for the Louisiana coast and the Lower Mississippi River.
- Worked with Coastal Carolina University, the U.S. Geological Survey, and the South Carolina Office of Ocean and Coastal Resource Management to develop Web-based beach profile management and analysis tools. The Web-based system of tools supports central storage and maintenance of an extensive historical data set and provides for easy access and consistent analytical methodologies.
- Continued to support the development and implementation of a Regional Sediment Management Plan as part of the California Coastal Sediment Management Master Plan.
- Initiated first phase of a basin-wide sediment yield analysis for the Niobrara River Basin, NE. This 3-year study is conducted in collaboration with the United States Department of Agriculture, the Natural Resource Conservation Service and the local Natural Resource Districts. Information developed by the study will be used to determine the feasibility of managing sediment from the Niobrara River Basin to reduce impacts to Lewis and Clark Lake and will serve as a model for regional sediment management planning elsewhere in the Missouri River Basin.
- The Howard Hanson Dam (HHD) Sediment Management Project is a component of the general restoration program at HHD and the Green River. In 2007, the Seattle District

calibrated sediment transport models for the HHD reservoir and the lower reaches of the Green and Duwamish Rivers. A series of experimental drawdowns will be conducted in the winter of 2008 to investigate sediment erosion and transport in the reservoir and downstream effects.

- **Southeast Coast of Oahu, Hawaii:** Performed a sediment trend analysis offshore of Wailea Point to determine net sediment transport, dynamic behavior of sediments, and potential suitability of offshore deposits as source material. Launched an Internet mapping service that provides access to study data and information for the public and other science and resource interests.
- **Littoral Drift Restoration Program, Benson Beach, WA:** The intent of the program is to return sediment to the littoral drift of southwest Washington in order to provide material to eroding shorelines within the mouth of the Columbia River littoral cell.
- **Coastal Zone Mapping and Imaging LIDAR, University of Southern Mississippi:** Coastal zone mapping and imaging LIDAR will improve the ability to accurately measure coastal and seafloor elevations, water quality parameters, and environmental features under a wide range of conditions. The program initiated development of an integrated LIDAR and imaging electro-optic sensor and developed new data fusion algorithms.

Water Operations Technical Support

The Water Operations Technical Support (WOTS) Program is funded out of the Operation & Maintenance appropriation. The WOTS Program provides for the effective transfer of environmental and engineering technology to address water resources environmental problems at USACE reservoir and waterway projects, and in river systems affected by project operations nationwide. WOTS is managed as a comprehensive centralized program that will maximize cost effectiveness and ensure broad dissemination and implementation of technology and information. Maintaining the environmental and water management conditions at 562 reservoirs (5,500,000 surface acres), 237 navigation locks, 926 harbors, 75 hydropower projects, and 25,000 miles of inland and coastal waterways impacted by the operation of Corps

projects requires compliance with numerous statutes and state standards. The WOTS Program's direct technical assistance function provides rapid direct technical assistance to USACE project offices in applying technology to solve water quality and other environmental problems. The technology transfer function is designed to ensure the effective use of technologies through the appropriate transfer of information and techniques using a variety of media. Short-term field demonstration efforts for the verification of tools developed through R&D and the application of management strategies, techniques, and approaches are important WOTS functions. By disseminating knowledge of new capabilities to field offices, the WOTS Program will continue to perform a critical technology transfer role in support of all USACE water resources.

Accomplishments in FY 2007 include:

- Provided technical assistance in response to requests by field offices confronted with water quality and other environmental problems. Responses covered diverse issues, including water quality management, watershed management, fisheries, shoreline erosion control, invasive species, sedimentation, and stream stabilization.
- The program conducts numerous training workshops on water quality and environmental management techniques. In 2007, these workshops were attended by approximately 1,000 personnel from Corps Districts, other federal agencies, state agencies, local agencies, private industry, and universities.
- A continual endeavor of the WOTS Program is coordination with water quality and environmental elements of other federal agencies such as the Environmental Protection Agency, Tennessee Valley Authority, Bureau of Reclamation, Fish and Wildlife Service, U.S. Geological Survey, and the Bonneville Power Administration. These efforts have involved watershed management activities, problems related to the introduction and spread of aquatic invasive species, environmental impacts of hydropower facilities, and impacts of water releases in tailwater areas on fisheries.

Scientific and Technical Information Centers

Five information analysis centers located at the ERDC provide the major interface between the Corps and the public and private sectors to gather and disseminate information as required by Public Law 99-802, Federal Technology Transfer Act of 1986. The function of each center is to acquire, examine, evaluate, summarize, and disseminate newly published scientific and technical information generated within the Corps' and other activities in the United States and abroad.

The Coastal Engineering Information Analysis Center focuses on wave data and predictions, shore processes, inlet dynamics, navigation channels and structures, harbors, and coastal construction. The Cold Regions Engineering Information Analysis Center focuses on ice engineering, meteorology, climatology, geophysics, geology, remote sensing, global and climate change, and environmental engineering. The Concrete Technology Information Analysis Center focuses on cements, concrete, aggregates, concrete construction, concrete repair, and rehabilitation technology. The Hydraulic Engineering Information Analysis Center focuses on hydraulic, hydrologic, water resources, and sedimentation of streams, rivers, waterways, reservoirs, and natural impoundments; estuaries, and inland and coastal groundwater; fishery systems; and hydraulic structures of all types. The Soil Mechanics Information Analysis Center focuses on embankment and foundation engineering, earthquake engineering, engineering geology, and rock mechanics.

The information centers critically evaluate and summarize the technical validity and merits of published and unpublished research and technical publications on design, construction, or other technology utilization. User communities have been well established and distribution lists for technology transfer are continuously updated. Electronic media including the Web are used where appropriate. The effectiveness of activities and services is evaluated on a continuing basis, and technology transfer products and methodology are revised when appropriate.

CUSTOMER SUPPORT

Increasingly, ERDC expertise and products developed in R&D programs are being requested to solve challenges in critical areas of concern. Following are a few examples of the many projects

the ERDC conducts for its many customers, listed by ERDC laboratory.

Reimbursable highlights from Coastal and Hydraulics Laboratory

Turbine Passage Survival Program (TSP). Under present conditions, direct fish survival through a Columbia and Snake River turbine ranges from approximately 89 to 94 percent. ERDC engineers are conducting research to gather information that will allow an accurate evaluation of fish passage benefits associated with turbine operational changes and changes resulting from the incorporation of improved fish passage turbine design concepts. The TSP defines the need to understand the hydraulic conditions within the turbine environment in order to develop reasonable solutions to the problem of fish passing through turbines. However, trying to understand what is happening within a turbine on the Snake and Columbia River is extremely complicated. The conditions are very harsh, with velocities as high as 50 ft/s, rapid pressure changes, rapid flow decelerations, high levels of shear, and constantly changing relationships between water flow and rotating parts. Other complications include the large size of the turbine passage area, the difficult access due to the depth of the intake, and the limited visibility due to high turbidity. Cameras can only capture a few feet of the water column that may be 20 ft wide, over 45 ft high, and 100 ft long.

ERDC's use of hydraulic scale models offers solutions to many of the difficulties associated with turbine study. Two types of hydraulic models are being used in this study: performance models (typically used by turbine manufactures to determine expected turbine performance) and fish passage models (used to examine flow characteristics through the turbine passage).

The ERDC turbine physical models include a model turbine, the downstream draft tube, and the exit to tailrace, which allows detailed examination of the complete passage route of water through the turbine environment. The models are made of clear plexiglass allowing high visibility and easy data collection. A non-intrusive laser Doppler velocimeter, neutrally buoyant beads, dye, videotape, and photography are utilized to collect data and visualize flow patterns and fish passage routes. Due to the smaller scale, the improved access, and better visibility, options can be built and tested faster in a model than in the prototype, at a much lower cost.

Studies are not linked to the fish window, allowing year-round testing. These models can also be used to develop prototype tests and provide information for input into numerical models (important for study of the turbine area). Hydraulic models enhance the ability to understand what is physically happening within the turbine environment. Information on how these conditions actually affect fish passage is also collected. The models are verified that they accurately represent prototype conditions. The model test program is closely tied to a prototype test program (including both physical and biological testing) to verify conditions identified in the models.

Combined Wave and Surge Overtopping of Levees. ERDC scientists are contributing to an expanding research program investigating the hydrodynamics of levee overtopping. In coordination with the New Orleans District, ERDC conducted controlled scale model experiments to examine the hydrodynamics of flow on the landward-side slopes of levees caused by a combination of storm surge overflow and irregular wave overtopping. Combined wave and surge overtopping was responsible for significant failures of earthen levees during Hurricane Katrina. Engineers now realize that they need to provide robust erosion protection to landward-side levee slopes if the levees cannot be raised to a level that prevents overtopping, but there are no design procedures for estimating either the velocity, flow thickness, or overtopping discharge for the most problematic case of combined wave and surge overtopping. Furthermore, no armoring products have ever been tested for stability under these unsteady flow conditions.

A 1-to-25-scale physical model with necessary instrumentation to document many of the characteristics of the unsteady flow due to combined waves and surge overtopping was designed. A total of 27 unique combinations of overtopping surge level and irregular wave conditions were simulated in the overtopping flume. A relationship was developed for estimating the average overtopping discharge due to combined wave and surge overtopping in terms of the incident significant wave height and the height of the storm surge above the levee crest. Two previous equations for estimating average overtopping discharge for this case were not based on any measurements or observations, and they both overestimated the actual discharge.

The time-varying instantaneous overtopping discharge was measured and a cumulative probability distribution of discharge successfully developed. The distribution will be useful for describing the probable

variation in discharge likely to occur at overtopped levees. A key aspect of the research was to characterize the unsteady, supercritical flow down the landward-side slope. While this had never before been attempted, this type of information is vital for evaluating potential armoring alternatives. Based on the laboratory model measurements, ERDC developed empirical equations for the average flow thickness, average flow velocity, root-mean-squared flow thickness, and velocity of the wave front. These new equations are the first to predict the unsteady flow parameters due to combined wave and surge overtopping, and they will serve as the basis for design guidance needed to specify adequate protection for landward-side levee slopes.

Multi-Purpose Sustainability of Tybee Island and Savannah Harbor Deep-Draft Navigation. ERDC scientists provided Savannah District technical assistance with a cutting-edge integration of numerical modeling and morphological analysis of historical shoreline and shelf bathymetry change dating back to the mid-1800's. The work included the generation of pre- and post-project sediment budgets. The change in morphology, sediment budget and modeling of circulation, waves, and sediment transport processes were evaluated through a collaboration between ERDC and the Savannah District. The result was an improved capability to document and measure the impacts that dredging and navigation structures had on the deflation of the shelf and formation of erosion hotspots on the adjacent beach in a complex multi-inlet coastal environment. The multi-purpose nature of this research provides for continued operation of a critical deep-draft national port while sustaining unique and significant national shoreline habitat.

Reimbursable highlights from Cold Regions Research and Engineering Laboratory

USACE National Federal Emergency Management Agency (FEMA) Project Delivery Team (PDT). The USACE Remote Sensing/GIS Center of Expertise, located at CRREL, manages the USACE National FEMA PDT. The FEMA PDT began in October 2004 with two primary goals: to provide nationwide support to FEMA for its Map Modernization (MapMod) and other hydraulics and hydrology studies, and to provide capacity building to the Hydrology, Hydraulics, and Coastal CoP. The PDT also facilitates effective virtual teaming, especially important since FEMA regional boundaries cross USACE Division and District

boundaries. The PDT is currently handling approximately \$7M in MapMod studies, with the participation of 21 Districts in six Divisions, plus the Remote Sensing/GIS Center of Expertise and the Coastal and Hydraulics Laboratory. The primary benefit of this collaborative effort is that flexible teaming between Districts helps USACE meet FEMA's tight time deadlines for MapMod Projects in a manner that allows USACE to build and maintain core competencies in hydrology, hydraulics, and coastal engineering within a geospatial framework. FEMA benefits through the involvement of local USACE Districts with intimate knowledge of past, present, and future projects impacting flood damage reduction.

Dam Decommissioning, Sandusky River. CRREL is assisting Buffalo District regulatory, planning, and engineering and construction functions through an analysis of the Ballville Dam on the Sandusky River, in Fremont, OH. The Great Lakes Fisheries and Ecosystem Restoration Program prompted efforts to investigate the environmental benefits of removing the Ballville Dam to allow migratory fish, particularly walleye, to gain access to upstream reaches of the Sandusky River and increase their spawning ground. Fremont has a long history of flooding events, some catastrophic, and many have been made worse by the presence of ice jams. This analysis focused on the ability of the dam to retain ice during the most significant ice jam events, and showed that the Ballville Dam has had an impact on reducing damaging ice jams in Fremont. Further investigations will focus on the risk of flooding and ice damage to bridges and floodwalls caused by the additional ice from upstream of the current dam to downtown Fremont. Two major alternatives for controlling ice in the absence of the Ballville Dam are ice piers and active river ice management. The results of the study are significant because dam decommissioning in northern rivers is an increasingly popular method of ecosystem restoration, but care must be taken to balance the flood damage reduction and emergency management impacts associated with dam removals.

Modeling Ice Impacts on Armor Stone Revetments at Barrow, AK. As the Arctic ice cover continues to recede, the Alaska District is met with increasing demands for cost-effective coastal erosion designs. While the wave climate is not severe at Barrow, AK, increased open water area and ice-free conditions extending into the early fall have resulted in increased shoreline erosion and adverse impacts on the community's infrastructure. Of particular concern are wind-driven ice events, known to

Alaskan Natives as “ivus”, where large sheets and bergs are driven into the shoreline. A series of refrigerated scale model tests were completed at ERDC facilities to simulate the impact of ice shoves on a proposed coastal protection structure to be constructed at Barrow. The tests showed that ice forces are much higher than wave-induced forces for this part of the Arctic coast. Test results were used by the Alaska District to modify the design of the erosion protection structure.

Design Support to Antarctic Program for Overland Fuel Transport to South Pole. The National Science Foundation (NSF) research program at the Amundsen-Scott South Pole Station is supported logistically by ski-equipped LC-130 aircraft from McMurdo Station on the coast of Antarctica. In terms of tonnage of material transported to the South Pole, approximately 50% is fuel. This includes the fuel used by the LC-130's to transport fuel. CRREL engineers, working closely with NSF and its logistics contractor Raytheon Polar Services, developed an innovative sled system pulled by commercially available rubber-tracked tractors to transport fuel to the South Pole overland. The 1,000-mile over-snow route requires very little trail preparation and traverses the Ross Ice Shelf and Leverett Glacier as it climbs 10,000 ft to the Polar Plateau. Convoys consisting of eight to ten tractors, conducting three trips per season, can supply essentially all the annual fuel needs at the South Pole Station. Overland re-supply to the South Pole Station reduces fuel consumption by a factor of four and air emissions by more than 100-fold compared with re-supply by aircraft. It will potentially save millions of dollars annually and free valuable LC-130 flight time for science missions around the continent.

ERDC Leads Arctic Sea Ice Experiment: Dynamic Nature of the Arctic. The Sea Ice Experiment: Dynamic Nature of the Arctic (SEDNA) team completed a 3-week field program in the Alaskan Beaufort Sea in March 2007, marking the successful completion of one of the initial activities of the International Polar Year. The primary objective of the SEDNA project is to advance the understanding of the complex interaction between the atmosphere, sea ice cover, and ocean. Results are being used to improve models of the sea ice cover, leading to better predictions of future changes and assessments of the impacts of these changes on regional and global communities. CRREL staff made critical contributions as members of the international team of scientists. The SEDNA program had strong diversity and educational outreach components with the participation of women in key leadership roles

and a Vermont high school teacher. Fifteen students and early career researchers participated on the field team.

Reimbursable highlight from Construction Engineering Research Laboratory

Update of the Environmental Assessment and Management (TEAM) Guide for USACE Civil Works. The TEAM Guide, State Supplements to the TEAM Guide, and the Environmental Review Guide for Operations (ERGO) Supplement have been designed to aid both internal and external assessors in evaluating environmental compliance and management practices at Corps facilities. The guide and its supplements address applicable Corps and Army regulations and Corps environmental assessment policies. The Corps of Engineers (Civil Works) has limited personnel and budgetary resources to meet baseline compliance auditing requirements and limited tools to document and track findings and deficiencies through abatement. CERL assists in implementing the environmental compliance requirement through auditing services and automated safety and environmental regulatory resources and auditing tools, resulting in access to real-time compliance data for use in developing future program initiatives and determining implementation direction. The TEAM Guide and its supplements were developed in 1994 by the Corps, in partnership with Air Force Center for Environmental Excellence, National Guard Bureau – Environmental Programs Directorate, Army Environmental Center, Air National Guard, U.S. Army Reserve Command, and Defense Logistics Agency for use by all DoD components. This partnership has been expanded to include non-DoD agencies, specifically the U.S. Postal Service, National Aeronautics and Space Administration, U.S. Forest Service, Department of Energy, and Department of Homeland Security, thereby reducing the product development cost to the Corps.

Reimbursable highlights from Environmental Laboratory

Endangered Sturgeon Studies in the Mississippi River. The pallid sturgeon is an endangered fish species impacting Corps navigation and flood control projects. Potential anthropogenic impacts to pallid sturgeon include habitat alteration by dredging, dikes, revetments, water diversions; blockage of migratory routes by locks and dams; and commercial sand and gravel mining. A jeopardy

opinion has been issued by the Fish and Wildlife Service for Corps activities on the Missouri and Middle Mississippi Rivers, and there has been concern that similar impacts may be occurring in the Lower Mississippi River. A 5-year research study funded by Mississippi Valley Division demonstrated that populations appear stable or even expanding, dispelling the notion that this species will become extinct unless the Corps spends substantial funds on habitat improvement projects. ERDC's population models confirmed that commercial fishing of shovelnose sturgeon in the Middle Mississippi River between the mouths of the Ohio and Missouri Rivers may be threatening the sympatric, endangered pallid sturgeon due to incidental harvesting (i.e., the two species are difficult to distinguish). As a direct result of these studies, the Corps has recommended that commercial harvesting cease before implementing expensive habitat restoration projects.

Mississippi Coastal Improvement Project. The Mississippi Coastal Improvement Project is supported by a multi-disciplinary ERDC team consisting of 21 biologists, ecologists, hydraulic engineers, civil engineers, and mathematicians. The group was assembled to support the Mobile District's fast-tracked emergency response study in reaction to the devastation caused on the Mississippi Gulf Coast by Hurricanes Katrina and Rita. Other collaborators included the Fish and Wildlife Service, the State of Mississippi, and other federal and local agencies. The ERDC team advised the Mobile District in ecosystem functional analysis, hurricane storm surge modeling and frequency analysis, a preliminary assessment of the water quality and ecological impacts of proposed freshwater diversions, and risk-informed multi-criteria decision analysis needs. They also helped the District decide on appropriate methodologies and models to generate the information needed, participated in multi-disciplinary problem solving, responded to comments from internal and external review, and gave presentations at public input events. The combined results form the basis for future planning, engineering and design work, and operational plans of potential freshwater diversions, thus guiding the potential expenditure of hundreds of millions of dollars.

Fish Passage Design, Environmental Benefits Analyses, and Incremental Cost Analysis on the Truckee River. ERDC is assisting the Sacramento District to scope a full range of alternatives for a basin-wide fish passage program on the Truckee River, extending from Lake Tahoe in California to the system's terminus at Pyramid Lake in Nevada. Fish passage concerns are one element in a larger

ecosystem restoration and flood management project in planning for the Truckee that enjoys significant support from Congress. ERDC is developing and implementing an alternatives analysis for upstream and downstream passage, including the cost effectiveness and incremental cost analyses. To support these analyses, an assessment of the environmental benefits and costs of alternative restoration strategies and techniques is being pursued. This is the only basin-wide fish passage project under way on a major river in the United States at this time. In addition to quantifying passage benefits at individual structures, the cumulative effects of passage are being examined in order to develop system-wide plans of alternative implementation.

Risk Assessment and Engineering Support for Inner Harbor Navigational Canal Lock Replacement. ERDC scientists and engineers provided technical support to the New Orleans District for the environmental assessment and engineering management assessment of sediments from the Inner Harbor Navigational Canal as part of the construction of the new lock. The effort included the completion of a comprehensive contaminant assessment in support of an Environmental Impact Statement following Hurricane Katrina. The studies included contaminant presence, toxicology, bioaccumulation, fate in aquatic and terrestrial systems, material characterization, and modeling. The results of the effort will enable the project to move forward and allow project managers to complete the project while complying with all environmental laws and regulations. Ultimately this effort will allow the construction of the Inner Harbor Navigational Canal Lock that will expand port facilities in New Orleans including the Mississippi River, Lake Pontchartrain, and the Gulf Intracoastal Waterway.

Evaluation of Herbicides to Selectively Control Invasive Submersed Plants. ERDC scientists provided the Minnesota Department of Natural Resources (MDNR) assistance for developing species-selective chemical techniques to manage public water bodies infested with the invasive aquatic plants Eurasian watermilfoil and curlyleaf pondweed. Results from small-scale studies carried out in ERDC facilities are being used to plan and conduct operational treatments in numerous lakes in Minnesota to reduce the abundance of the invasive weeds, while protecting and enhancing native plant communities that provide critical fish and wildlife habitat and improve water quality. The studies included herbicide dose-response characterization against target and non-target plants, fate of herbicide

residues in aquatic systems, and development of temporal strategies for optimizing species-selective control. Project sponsors and partners included the MDNR, local agencies (county and city), Mississippi State University, and the Aquatic Ecosystem Restoration Foundation.

Reimbursable highlights from Geotechnical and Structures Laboratory

Blast Mitigation Research. ERDC is currently conducting research and demonstrations in application of current research in mitigation of critical assets that include cable-stayed bridges, zoned embankments, and underwater tunnels. This effort was initiated in FY 2007 and is planned to continue through FY 2009.

Levee Assessment and Strengthening Research. This program seeks to develop technologies that will rapidly identify problem levees, develop affordable strengthening options for new and existing levees, and allow them to be repaired rapidly when and if a failure occurs. This effort was initiated in FY 2007 and is planned to continue through FY 2010.

Reimbursable highlight from Topographic Engineering Center

Comprehensive Evaluation of Project Datums. ERDC expertise in survey engineering was enlisted for the Comprehensive Evaluation of Project Datums (CEPD), a nationwide program to conduct a vertical datum review of all Corps federally authorized and constructed hurricane protection, shore protection, flood control, and navigation projects. ERDC coordinated the effort to implement lessons learned from the recent findings of the Interagency Performance Evaluation Task Force (IPET) on Hurricane Katrina. These findings highlighted the need to ensure that the Corps' flood control and navigation projects across the country are referenced to the proper vertical datums to correctly compensate for subsidence/sea level rise. The IPET findings also highlighted the need to ensure that all projects are adequately referenced to nationwide spatial reference systems used by other federal and local agencies responsible for flood forecasting, hurricane surge and inundation modeling, navigation, flood insurance rate maps, hurricane evacuation route planning, coastal boundary delineation, bathymetric mapping, and topographic mapping. This review is to inventory the

vertical datums used on all flood control, hurricane protection, and navigation projects; identify deficiencies in those datums that require corrections; develop a plan to transition to the correct datums; and implement appropriate project changes if needed. Accomplishments included the development of guidance documentation for the evaluation and reporting of project vertical datums (Engineer Circular 1110-2-6065), the development of a training class in coordination with NOAA, conducting a training and certification class for District Datum Coordinators from each Corps District, and development of a database and tool to track the evaluation process.

INSTITUTE FOR WATER RESOURCES

BACKGROUND

The U.S. Army Engineer Institute for Water Resources (IWR) is a field operating activity under the staff supervision of the Director for Civil Works, Headquarters, U.S. Army Corps of Engineers (HQUSACE). The Institute is the USACE center of expertise for integrated water resources management (IWRM), focusing on planning analysis and hydrologic engineering and on the collection, management and dissemination of Civil Works and navigation information, including the Nation's waterborne commerce data.

IWR was established by the USACE Chief of Engineers in 1969 with the approval of the House and Senate Appropriations Committees and the Subcommittees on Public Works in order "to enhance the capability of the Corps of Engineers to develop and manage the Nation's water resources, within the scope of the Corps' responsibilities, by developing essential improvements in planning to be responsive to the changing concerns of our society."

The Institute's mission is to facilitate the adaptation of the Civil Works Program to future needs by providing the USACE with the capability for developing forward-looking analysis and state-of-the-art methodologies. IWR fulfills this mission by supporting the HQUSACE Civil Works Directorate and USACE Major Subordinate Commands (MSCs) and District offices by providing: (a) analysis of emerging water resources trends and issues; (b) state-of-the-art planning and hydrologic engineering methods, models and training, and (c) national data management and results-oriented program and project information.

IWR CENTERS

IWR has offices at three locations, each of which is a USACE designated center of expertise (DX): the National Capital Region (NCR) and Navigation Data Center (NDC) offices in the Casey Building at the Humphreys Engineer Center, Alexandria, Virginia; the Hydrologic Engineering Center (HEC) in Davis, California and the Waterborne Commerce Statistics Center (WCSC) in New Orleans, Louisiana. WCSC is part of the Navigation Data Center (NDC).

National Capital Region Office: The IWR National Capital Region (NCR) office is the Corps designated center of expertise for the development of methods, models, and analytical tools used for water resources and water systems planning, investment decision-support, environmental (natural resources) conflict resolution, and international water resources. IWR fulfills this mission through a synergy of water resources planning and socio-economic expertise that blends practice with research, policy development and information. IWR planners, economists, social scientists, civil engineers and specialists in the physical sciences lead Civil Works strategic planning and technology transfer initiatives; conduct national and focused policy development studies; develop a broad range of partnering and investment decision-support techniques, methods and models for integrated water resources management (IWRM) and navigation system applications; interact with national and international members of the water resources community at-large and partner with the HQUSACE, Corps field offices and laboratories in solving complex technical water resources planning and evaluation problems. In particular, the Institute provides a critical mass of socio-economic expertise within the Corps and serves as the residence for the USACE Chief Economist position, which is responsible for the leadership of the Corps Economics Community of Practice (CoP). IWR also provides a cadre of international water specialists who lead the USACE's engagement in water resources partnerships around the globe. Additional information about IWR is available on its web site at www.iwr.usace.army.mil.

Hydrologic Engineering Center (HEC): The primary goal of HEC from its inception in 1965 has been to support the Nation in its water resources management responsibilities by increasing the Corps technical capability in hydrologic engineering and water resources planning and management. An additional goal is to provide leadership for improving the state of the art in hydrologic engineering and analytical methods for water resources planning. Program efforts in research, training, planning analysis and technical assistance raise awareness of the problems and needs of the Corps and the Nation. HEC is committed to keeping abreast of the latest developments throughout the water resources engineering profession and to make use of this information in a manner best suited to the needs of the USACE nationally and internationally. HEC increases

the effectiveness of the Corps and the profession by bridging the gap between the academic community, practicing hydrologic engineers and planning professionals. HEC ground-tests and incorporates state-of-the-art procedures and techniques into manuals and comprehensive computer programs. The procedures are made available to the USACE, United States government and international professionals through an effective technology transfer system of technical assistance, publications, DVD's and training. Technical specialty areas addressed by HEC include: precipitation runoff processes, reservoir regulation, reservoir systems analysis, hydrologic statistics and risk analysis, river hydraulics and sediment transport, groundwater hydrology, water quality and analytical aspects of water resources planning. Application areas include: flood risk management, real-time water control, water control management, hydroelectric power, navigation, erosion control, water supply, watershed studies and ecosystem restoration. Additional information about HEC and its software is available on its web site at www.hec.usace.army.mil.

Navigation Data Center (NDC): NDC is the Corps designated center of expertise for the management of infrastructure utilization and performance information for U.S. waterways and port and harbor channels. Because of the integrated nature of water resources, NDC also directly supports a range of related Civil Works business areas, including hydropower, recreation, environmental compliance, environmental stewardship, water supply, regulatory and homeland security, as well as other Federal, state and local agencies and the private sector. The primary operational arm of NDC is the Waterborne Commerce Statistics Center (WCSC), which provides one-stop capability for national navigation information systems. NDC also provides integrated business information in support of Corps decision making including financial output, performance measurements and performance-based budgeting processes. Additional information about NDC is available on its web site at www.ndc.iwr.usace.army.mil.

FY 2007 SUMMARY

Post-Hurricane Context: The Institute's FY07 program served as an affirmation of IWR's status as an essential intellectual asset to the Corps Civil Works program, the overarching USACE missions, and the Nation's water resources. Many of the technical and policy development challenges faced in FY07 represented an extension of the ambitious program that emerged in the aftermath of Hurricanes Katrina, Rita and Wilma in 2006 and the devastation wrought along

the U.S. Gulf Coast. The resulting mix of planning, policy and research initiatives that IWR initiated in 2006 and continued through 2007 provides the overarching context for what has proved to be the most challenging, productive and rewarding period in the Institute's 38-year history. After years of preparatory planning, organizational enhancement, and strategic refinement of IWR's capabilities and focus, FY07 represented a pinnacle of the Institute's substantive technical contributions during what turned out to be an especially crucial timeframe for the USACE and the Nation given the urgent need to (1) restore hurricane risk reduction facilities for communities in the Gulf States, (2) determine why the hurricane system didn't perform as intended, while (3) concurrently planning for the future rebuilding of the Gulf Coast based on the principles of IWRM.

These natural disasters precipitated a wide range of ex-post inquiries, investigations and analyses that not only focused on determining the circumstances and cause of these disasters, but also addressed broader issues of policy interest, such as: revisiting the Nation's approach to and commitment for protecting citizens against flooding and coastal storms; reinforcing the need for comprehensive, systems-wide approaches to water resources management, including the full integration of the social, economic and environmental goals of society; and questioning the confidence in and effectiveness of public engineering and USACE flood and coastal storm damage reduction programs.

The U.S. and its principal agencies and science academies (in partnership with other government agencies, non-government organizations, professional societies, universities, and international organizations) undertook a number of comprehensive post-flood audits aimed at identifying lessons-learned to inform future decisions on how to harden the hurricane protection system and strengthen flood preparedness and response processes. Aspects of the review encompassed the design and safety standards used for infrastructure, governance and institutional considerations, along with examining the analytical principles and policies used for determining project scope, formulation and justification. The Institute actively participated in this unprecedented array of ex-post initiatives, which involved technical experts drawn from across IWR and the entire USACE.

Key Post-Katrina Activities: In particular, IWR played a central role on aspects of seven key initiatives:

- the completion of the interior flood control and the socio-economic consequences portions of the

Interagency Performance Evaluation Task Force (IPET) investigation into the engineering physics of the system failures within New Orleans and vicinity during Hurricane Katrina;

- leadership of the Hurricane Protection Decision Chronology (HPDC) assembly of the 50-year chronological record of planning, economic, policy, legislative, institutional and financial decisions that shaped the hurricane protection system for greater New Orleans;
- partnership with the Netherlands Rijkswaterstaat (Department of Public Works, part of the Ministry of Transport and Water Management) which facilitated the completion of a study by the “Netherlands Water Partnership” consortium to identify options for the long-term reduction of flood risks and landscape stabilization within the scope of the Louisiana Coastal Protection and Restoration project (LACPR). The resulting report, which identifies potential measures and strategies, is entitled: “*A Dutch Perspective on Coastal Louisiana Flood Risk Reduction and Landscape Stabilization*”;
- a series of technical workshops was conducted in The Hague and New Orleans to facilitate the intergovernmental exchange of views on a broad range of topics, including risk-informed decision making, advanced dredging technologies, soft soil improvement, non-structural floodplain management and design-build contracting;
- provision of direct planning support to the New Orleans District on the Congressionally authorized Louisiana Coastal Protection and Restoration (LACPR) study, which is developing the comprehensive risk reduction plan;
- formal activation of the National Flood Risk Management Program (which pre-dated the occurrence of Hurricane Katrina) and its acceleration on a national basis subsequent to the Gulf Coast disaster, which was instrumental in institutionalizing the Intergovernmental Flood Risk Management Committee (IFRMC) and initiating the National Levee Inventory and Assessment Program; and
- serving on the program development team for what became the major Corps organizational response to, and primary vehicle for technological and institutional reform based on the lessons learned from Hurricane Katrina—the **Actions for Change** (AFC) initiative. The USACE Chief Economist was appointed to lead the Risk Analysis AFC team, while specialists from the Institute actively participated in the Risk Communication and Comprehensive Systems (including Climate Change) teams.

Integrated Water Resources Management: While the Institute’s Future Directions Program and Civil Works Strategic Planning activities continued to foster a corporate recognition of the need for systems approaches to solving water resources problems, IWR specialists played central roles in advancing the practice of integrated water resources management (IWRM) through the successful completion of the Lake Ontario and St. Lawrence River Study for the International Joint Commission (IJC), and initiation of a follow-on IJC study on the International Upper Great Lakes (IUGLS) which is investigating the extent to which Lake Superior outflow water management affects the on-going changes in lake levels for Superior and Lakes Michigan Huron and Erie and their connecting channels, particularly the St. Clair River. The demonstrated value of practicing IWRM was also furthered by the involvement of IWR specialists in the Corps Western States Watershed Study, the co-leadership in collaboration with ERDC of the Gulf of Mexico Regional Sediment Management (RSM) demonstration program and other Corps RSM activities, and participation in pilot project partnerships with The Nature Conservancy on their Sustainable Rivers Program.

At the same time, IWR researchers worked to continue advancing IWRM planning, economic and hydrologic and hydraulic engineering tools, resulting in the 2007 issue of the new IWR-Planning Suite software, and the release of new editions of the full range of HEC’s flagship NexGen software products, along with the rollout and immediate field application of state-of-the-art systems models for maritime transportation economics as part of the Institute’s Navigation Economic Technologies (NETS) Research Program. Another significant technology milestone was the completion of the deployment and training phases for the OMBIL Regulatory Program Module (ORM 2.0), a web-based, enterprise GIS data management system now used by all USACE field offices, which provides the anchor technology for watershed-based analytics and decision-support for the Corps regulatory program, and is expected to play a foundational role for the entire Civil Works program.

Also during 2007, a key IWRM-related activity was the establishment of the Institute’s new “International Center for Integrated Water Resources Management (ICIWaRM)”. This USACE IWR center was subsequently nominated (in February 2008) by the U.S. Government (USG) as a global water center in conjunction with the UNESCO International Hydrological Programme (IHP). ICIWaRM would be the first U.S.-based UNESCO water center in the U.S.

Collaborative Planning and Partnerships: Through the Institute's role in supporting the USACE-wide implementation of the Civil Works Strategic Plan (2004-2009) and the ongoing development of the next Strategic Plan (2010-2014) in accordance with GPRA, IWR continued to promote, support and engage in intergovernmental collaborations and partnering throughout USACE, and with a wide range of national and international institutions and organizations as a means of accomplishing common goals. IWR continues to serve as the USACE lead for multiple national partnerships and is committed to developing new technologies, processes and policies to further collaborative planning and partnering.

IWR's partnering focus on national water resources issues in 2007 included representing both USACE and the Office of the Secretary of Defense (OSD) on the Executive Office of the President's National Science and Technology Council Interagency Subcommittee on Water Availability and Quality (SWAQ). IWR actively participated in the development of the SWAQ Strategic Plan for Federal water resources agencies to ensure adequate water availability and quality, culminating in the publication of the report "*A Strategy for Federal Science and Technology to Support Water Availability and Quality in the United States*", September 2007. IWR is likewise supporting USACE participation in the implementation of the President's Ocean Action Plan through integrated networks and partnerships of Federal, state, local, territorial and tribal authorities, the private sector, international partners and ocean communities.

In the advancement of collaborative planning models and guidance, IWR's National Cooperative Modeling and Collaborative Planning and Management Demonstration programs worked in synergy to test and demonstrate a variety of collaborative modeling tools and concepts. Given the Institute's long history of applying collaborative modeling tools through its signature Shared Vision Planning (SVP) process, IWR was positioned to advance and apply contemporary conceptual and methodological approaches, as well as documenting, vetting and publicizing the advances and experiences of other institutions.

This led to IWR establishing a new Conflict Resolution expertise center in 2007, while concurrently welcoming a significant new MOU partner - the U.S. Institute for Environmental Conflict Resolution, located within the Udall Center at the University of Arizona. These advances culminated in 2007 with the convening of a major workshop on Computer Aided Dispute Resolution (CADRe) that brought nine federal agencies, nonprofit organizations,

states, irrigation interests and the private sector together to share experiences on the use of collaborative computer modeling in solving water resources disputes.

In FY07, IWR also published a collaborative planning handbook for use by USACE field practitioners. The report entitled, "*Project Planning in Collaboration with Government Entities – Practical Approaches*" (IWR publication [07-R-02](#)) provides an introduction to the concept of collaboration as it applies to problem solving with Federal, state, and local governmental agencies.

The Institute executed a wide range of technical assistance projects, such as HEC's support of system-wide reservoir operations for the Lower Colorado River Authority (LCRA). IWR continued building international water partnerships with the appointment of IWR senior staff to the Governing Board of the United Nations Educational, Scientific and Cultural Organization (UNESCO) Institute for Water Education (IHE-Delft), and the Advisory Board of the International Center for Water Hazard and Risk Management (UNESCO-ICHARM).

Memorandums of Understanding (MOUs) were executed in FY07 with a number of universities and professional organizations, with these partnerships facilitating cooperation in technology, science and research in aspects of integrated water resource management and capacity building in developing nations and countries in transition. Each of the universities with which IWR has entered into MOUs has unique program features that compliment the strengths and talent of the Institute. These include new partnerships with The University of Arizona's Center for Sustainability of Semi-Arid Hydrology and Riparian Areas (SAHARA); the University of New Hampshire's Institute for the Study of Earth, Oceans, and Space, Water Systems Analysis Group; and the Oregon State University's Institute for Water and Watersheds. In addition, IWR executed its third international MOU partnership with a UNESCO-IHP water center - the Center for Humid Tropics of Latin America and the Caribbean (CATHALAC) in Panama.

Risk Analysis: IWR continued to provide technical assistance to the New Orleans District and Mississippi River Division on the congressionally authorized LACPR study. IWR senior staff specified a scenario-based, risk-informed planning approach to be integrated within the Corps traditional six-step planning process, and led workshops with LACPR staff to enhance understanding and advance the implementation of the planning framework for coastal

INSTITUTE FOR WATER RESOURCES

Louisiana. This served a complementary purpose of developing a nationally consistent risk-informed planning framework to support implementation of the risk-based concepts in planning, design, construction, operations, and major maintenance action of Actions for Change. IWR involvement was concentrated on implementation, using the LACPR study as a test-bed demonstration.

Adaptation to Climate Change: FY07 represented a milestone in the Corps involvement in and application of global climate change science, culminating in the policy affirmation for an adaptation strategy for the Civil Works Program reflected in the Congressional testimony of the Honorable John Paul Woodley, Jr., Assistant Secretary of the Army (for Civil Works), before the House Committee on Transportation and Infrastructure in May, 2007. IWR climate change specialists provided technical support to USACE and the OASA(CW) in the preparation of the testimony, and IWR subsequently accelerated its Climate Change policy development program, including the initiation of an interagency component aimed at developing consistent water management adaptation policies and approaches to address global warming throughout USACE CW's and in partnership with U.S. Geological Survey (USGS), the U.S. Bureau of Reclamation (BuRec), and the National Oceanic and Atmospheric Administration's (NOAA) Climate Program Office.

Nobel Prize Recognition: 2007 also represented a milestone for the recognition of the contributions of climate change scientists around the world, with the Norwegian Nobel Committee awarding the Peace Prize to former Vice-President Al Gore and the Intergovernmental Panel on Climate Change (IPCC). IWR's Dr. Eugene Z. Stakhiv, who has been an active contributor to the IPCC from its inception, co-chairing the first IPCC Water Resources Group, serving as lead author in the second and third IPCC reports, and participating as a reviewer of the fourth IPCC report, was honored by the IPCC and shared in the recognition for the Nobel Peace Prize.

Other Key FY07 Activities: Overall, IWR executed a FY07 program of approximately \$50 million with 150 in-house employees, primarily in professional disciplines with most possessing advanced degrees. IWR's in-house staff was supplemented by other experts detailed from USACE field offices and laboratories and Intergovernmental Personnel Act (IPA) visiting scholars from universities, state and local governments, policy think tanks and the private sector.

A major FY07 initiative for the Institute was accomplished through IWR's role as the Secretariat of the U.S. Section PIANC (the International Navigation Association), which convened the "Smart Rivers 2007 Conference", held in Louisville, KY. This was the first time the U.S. Section PIANC had organized a major industry conference and the outcome was a resounding success with more than 200 navigation professionals in attendance. The theme of the conference was "Positioning Inland Navigation as a Powerful Link in the Global Supply Chain", with the USACE Director of Civil Works, MG Don T. Riley and Sean T. Connaughton, U.S. Maritime Administrator, serving as the keynote speakers.

In 2007 IWR institutionalized two additional international programs: the Civil-Military Emergency Preparedness Program (CEMP), and Emergency Management International (EMI) Program. In particular, CEMP activities in 2007 focused transferring to other nations a fundamental understanding of how disaster response is managed by U.S. federal agencies; an introduction to emergency response in the private and public sectors in democracies; national GIS seminars and workshops; evaluations of disaster response capability; regional GIS seminars; how to develop national response plans; how to build national emergency operations centers; national and regional response to all (or any specific hazard); and special topics as determined by the host nation. Specific events/activities in 2007 were held with the Black Sea Initiative; support of the South Eastern Europe (SEE) Council; and meetings within the Balkans region, including GIS workshops; and with the U.S.-Russian Joint Emergency Management Committee.

In FY07 HEC engineers provided training in water resources engineering in Nairobi, Kenya and Addis Ababa, Ethiopia as part of the Combined Joint Task Force – Horn of Africa (CJTF/HOA) host nation agreement. HEC specialists also performed a critical levee evaluation and engineering performance analysis for a levee along the Anseung River protecting Camp Humphreys in Korea.

FY07 marked the conclusion of Dr. Gerald Galloway's tenure as IWR's Arthur Maass - Gilbert White Visiting Scholar. Dr. Yacov Haimes, University of Virginia was appointed his successor as Maass - White Scholar for 2007 - 2008. Dr. Leonard Shabman remained with IWR throughout FY07 working on several efforts. These included completing his work with Dr. Douglas Woolley (retired Professor of Economics from Radford University) on the HPDC investigation.

IWR's specific accomplishments during FY07 are described in the following sections, organized in accord with the Institute's major focus areas.

FUTURE DIRECTIONS

The Institute's Future Directions activities include the identification of emerging water challenges and opportunities and the tactical engagement of USACE senior leaders on these issues to stimulate "strategic thinking." Such critical thinking is seen as an essential prerequisite to strategy development and planning. IWR employs a variety of approaches to encourage strategic thinking, including the development of water resource outlook papers and the conduct of topic specific provocation sessions with senior leaders. Outlook papers that were presented at provocation sessions during FY07 included: "*U.S. Water Demand, Supply and Allocation: Trends and Outlook*" (IWR Publication [07-R-03](#)) and "*Maritime Transportation System: Trends and Outlook*" (IWR Publication [07-R-05](#)). External and internal subject matter experts and stakeholders joined IWR staff at these sessions.

In FY07, IWR continued to use two innovative instruments to engage senior leaders strategically: the "Castle Forum" and the "Lunch Roundtable." The Castle Forum, an off-site event for senior leaders and external thought leaders where they can engage in out-of-the-box thinking regarding subjects not usually addressed by them specifically, is intended to provide a venue for leaders to recognize (previously undetectable) signals of weakness and anticipate potential implications. Castle Forum subjects explored during FY07 included "Chaos and Complexity Theory," "The Competitive Approach to Modernizing the Business of Government," and "Government and Other Factors in 2050". The Lunch Roundtables brought in water experts from outside the Corps to provide perspectives on issues familiar to senior leaders. Topics discussed during FY07 included, "Taking a Systems Approach to Water Resources Management," "Engineering Ethics and Organizational Structure," and "Partnering with States to Support Integrated Water Resources Management."

Strategic Planning: FY07 strategic activities continued to address implementation of the current Civil Works Strategic Plan and informed the intellectual development of the next strategic plan through research, identification of new challenges and strategies based in part on scenarios developed in FY06, and outreach. IWR supported a session designed to elicit stakeholder responses to the aforementioned scenarios. It should be noted that the

release of the inaugural Civil Works Strategic Plan in 2004 represented the culmination of a multi-year effort aimed at establishing a new direction for the Civil Works Program based on the contemporary IWRM "watershed" planning approach. The plan's five strategic goals were firmly grounded in the "systems" perspective of IWRM and are fully aligned with the principle of environmental sustainability.

The Institute's technical experts and OMBIL national data management systems continued to support the formulation of the yearly budget guidance, the five-year development plan and the evaluation of USACE Civil Works program business areas in conjunction with the Office of Management and Budget (OMB) Program Assessment Rating Tool.

Post-Katrina Studies: In FY07, work continued on the Interagency Performance Evaluation Task Force (IPET) Risk and Reliability modeling effort to develop flood risk maps for the New Orleans metropolitan area as Task Force Hope completed construction on the Lake Pontchartrain and Vicinity Hurricane Protection System. IWR and HEC staff provided updated consequence data and interior modeling to support the map updates. IWR also provided planning support to the Louisiana Coastal Protection and Restoration (LACPR) study. This congressionally authorized 24-month study will produce a report in FY08 documenting the development and analysis of a comprehensive hurricane protection system. As part of that support, IWR has been assisting the LACPR team to develop a risk-informed planning and decision making framework that is intended to also have national application. Complementary risk assessment tools will be developed through the Actions for Change program.

Interagency Performance Evaluation Task Force (IPET): The results of the analysis and technical documentation for the IPET Interior Drainage and Consequences tasks are included in IPET report "*Volume VI: The Performance — Interior Drainage and Pumping*" and "*Volume VII: The Consequences.*"

The *Consequences* report developed information on the full range of consequences from Hurricane Katrina. The analysis and report were completed by a team of over 50 economists, sociologists and environmental scientists from IWR, HEC, the Engineer Research and Development Center (ERDC), Corps districts, academia and consultants. Direct flood damages to private property were estimated using an innovative GIS census block based assessment for the 5-parish greater New

Orleans area. The approach allowed the estimation of potential flood damages at flood stages both below and beyond those experienced during Katrina. The impact of the Katrina flooding on the New Orleans community infrastructure was documented. This neighborhood infrastructure supported the local society and culture and enhanced the quality of life in the greater New Orleans region. Scientists from ERDC provided the analysis of the environmental impacts of Katrina flooding and the subsequent dewatering of the flooded parishes. The available information on the human health and safety impacts of Hurricane Katrina was also documented, including loss of life and a wide range of other physical and mental health outcomes. *Volume VII: Consequences* was one of the first volumes released as final by IPET.

The IWR Consequences team also developed stage-damage and stage-fatality functions that provide estimates of direct property loss and life loss as a function of inundation elevations for different parts of the greater New Orleans area. In FY07, these functions were used by the IPET Risk and Reliability team to develop estimates of the probability distributions of life loss and direct physical damage relating to the expected performance of the Hurricane Protection System in Greater New Orleans as of June 2007 associated with a wide range of possible hurricane events with different severities, directions, and points of landfall.

Hurricane Protection Decision Chronology: In FY05, IWR developed the study plan, formed the study team and initiated the Hurricane Protection Decision Chronology (HPDC) investigation. The HPDC team is composed of external experts on water resources policy and planning and non-Federal flood and storm water protection. The team interviewed individuals and reviewed 50 years of documentation to assemble a chronological record of planning, economic, policy, legislative, institutional and financial decisions that influenced the design, scale, configuration and condition of the Greater New Orleans hurricane protection system. The HPDC was established at the direction of HQUSACE and is complementary to IPET.

During FY06, the team produced a draft report that underwent internal independent technical reviews (ITRs) and an external review by a panel of experts convened by the National Association of Stormwater and Flood Management Agencies (NAFSMA). The team gave briefings to Corps leadership and the Assistant Secretary of the Army (Civil Works). A draft final report and database of source documents

were publicly released via the IWR website in the third quarter of FY07 after undergoing a third round of internal technical review. The final report will be published in FY08, which will include a compact disc containing the more than 350 project-related documents reviewed for the report.

Intergovernmental Panel on Climate Change: The Institute has been involved in climate change impacts analysis and research since 1978. In 1988, the World Meteorological Organization and the United Nations Environment Programme, recognizing the need for an objective, balanced, and internationally coordinated scientific assessment of the understanding of the effects of increasing concentrations of greenhouse gases on the earth's climate and on ways in which these changes may impact socio-economic patterns, established the International Panel on Climate Change (IPCC).

Dr. Eugene Stakhiv has co-chaired the IPCC's committee on water resources and participated in the preparation of the four Assessment Reports of the Panel (1990, 1995, 2001 and 2007).

In 2007, the Norwegian Nobel Committee awarded the Peace Prize to the Intergovernmental Panel on Climate Change. For his many contributions to the IPCC, Dr. Stakhiv was honored by the Nobel Committee and shared in the Nobel Peace Prize.

Actions for Change: Actions for Change were developed to address the lessons learned from the Hurricane Katrina and Rita disasters. The goals of the Actions are to improve public safety and the Nation's water resources infrastructure by providing expert and professional services to the Nation. The Actions for Change are divided into four themes: (1) Comprehensive Systems Approach, (2) Risk Informed Decision Making, (3) Communication of Risk to the Public, and (4) Professional and Technical Expertise. IWR is actively participating on the core teams for the first three themes.

Theme 1 (Comprehensive Systems Approach) is emphasizing integrated, comprehensive and systems-based approaches that incorporate anticipatory management so infrastructure systems will be adaptable and sustainable over time. IWR is leading the Temporal and Spatial System Changes project delivery team (PDT). The objective is to review the dynamic processes that potentially impact USACE projects and to develop guidelines and recommend policy and program changes to address the changes and their impacts. The PDT will leverage their activities with IWR's project on "Corps Adaptations to

Climate Change.” Many IWR activities support Theme 1 and the comprehensive systems approach. These activities include developing a framework for environmental sustainability and guidelines for multi-objective planning that include other social effects such as public safety.

Theme 3 (Communication of Risk to the Public) emphasize the communication of flood risks to the public and public involvement in flood risk management decision making. Initiatives will focus on concepts of residual risk and the involvement of disadvantaged populations that are most likely to be impacted by floods. IWR is leading the Public Involvement subteam, and is presently partnering with the National Flood Risk Management team to develop a framework for public involvement in flood risk management decision making. Future activities will include public involvement training, further development of the framework and associated policy changes, as well as pilot studies.

To implement the Actions for Change initiative, a program development team that was familiar with IPET and HPDC results and implications was established, composed of senior technical experts from HQUSACE, IWR, ERDC and Corps field offices. IWR actively participated in the development of the Actions for Change and led development of a key risk-informed planning and decision making framework component, leveraged through IWR’s work in support of the LACPR study.

Adaptations to Climate Change: IWR has initiated a project to address USACE adaptations to climate change. The objectives of the project are to develop consistent approaches to climate change science throughout USACE and in partnership with other Federal agencies. The project will also provide recommendations for policy and guidance to prepare for, and respond to, climate change and variability. IWR organized a meeting at USACE headquarters on climate change and water resources in May 2007. Representatives from USACE, the U.S. Geological Survey (USGS), the U.S. Bureau of Reclamation (BuRec), and the National Oceanic and Atmospheric Administration’s (NOAA) Climate Program Office and Hydrology Program attended. An interagency group was formed to consider what actions Federal water agencies should take to incorporate climate change considerations into water resources activities.

IWR also supported the Western States Watershed Study as technical lead for a pilot study evaluating the impacts of warming temperatures on reservoir rule curves in California. USACE guidance on sea level rise in project planning is also being revised.

Louisiana Coastal Protection and Restoration (LACPR): During FY07 IWR continued to provide technical assistance to the Corps’ New Orleans District and Mississippi River Division on the congressionally authorized LACPR study. In partnership with ERDC, a small team of risk analysis experts developed a decision framework that weaves together quantitative risk assessment, scenario planning and risk-informed decision making with active and transparent stakeholder involvement. IWR senior staff outlined a process to integrate risk-informed planning within the traditional six-step planning process, then led workshops for LACPR staff to enhance understanding and advance the implementation of the planning framework for coastal Louisiana. IWR also advised the LACPR study team on best planning practices, and an IWR senior social scientist lead the formulation and evaluation of non-structural components to the comprehensive risk reduction strategies. This combined effort served a complementary purpose of developing a nationally consistent risk-informed planning framework to support implementation of the risk-based concepts in planning, design, construction, operations, and major maintenance action of Actions for Change. IWR involvement was concentrated on implementation, using the LACPR study as a test-bed demonstration.

USACE Chief Economist: Dr. David Moser of IWR is the USACE Chief Economist and leader of the Economics Community of Practice (CoP). During FY07, the Chief Economist continued to provide support to the IPET Risk and Reliability team.

The Chief Economist’s leadership engaged to build and advance the economic analysis capability across the USACE, holding two national meetings and regular teleconferences with senior economists.

A subject matter expert (SME) database of all Corps economists was reviewed and updated by senior economists to maintain a directory identifying economists by experience and expertise for each economic activity conducted by the USACE. This SME database is used by MSC economists, planning centers of expertise and others to identify resources for feasibility studies, ITRs and special purpose teams. In FY06, the senior economist group started the expansion of the SME database to include more detailed knowledge, skills and abilities (KSAs).

As a complementary activity to building capacity, the Chief Economist focused on enhancing technical guidelines and economic manuals available to field practitioners. In FY07 work proceeded on the update of water resources planning National Economic Development (NED) Manuals. The Chief Economist

participated in selection boards for senior economists throughout the Corps and was involved in issues relating to NED evaluation of transportation externalities, agricultural water supply and value of time saved.

In FY07, the Chief Economist was appointed as the National Lead for Risk Informed Decision Making, one of the four themes in the restructured Actions for Change initiative. As part of that effort, the Chief Economist led development of approaches and frameworks to articulate the value of risk analysis, with emphasis on risk management, to Civil Works decision making.

National Shoreline Management: The National Shoreline Management program, authorized in 2000, remains a collaborative, inter-agency effort that is adapting to the recent surge in coastal and ocean initiatives. The study is intended to describe the extent and causes of erosion and accretion along the shores of the U.S., the economic and environmental effects caused by erosion and accretion, and the systematic movement of sand along the shores. It will describe the resources committed by Federal, state and local governments to restore and nourish shores, recommend appropriate levels of Federal and non-Federal participation in shore protection and use a systems approach to sand management.

Initiatives and events have influenced the future course of national shoreline management program. These include the President's formation of a Committee on Ocean Policy and an associated new ocean governance structure; U.S. Geological Survey publication of the results of shoreline change studies; the initiation of a National Coastal Data Bank; joint coastal mapping initiatives; emerging joint Federal coastal science and technology collaborations; and the formation of regional coastal collaborations to address ocean and coastal management in an ecosystems context.

By the end of FY07, the study management team had engaged partner agencies in discussions of how the study could best serve and integrate ongoing initiatives to improve agency program integration and effectiveness with emphasis on systems approaches to Federal and non-Federal roles in shoreline management. The study team has begun preparing an interim report that will summarize study products as well as results of other initiatives in terms of answering the study directives and making recommendations for proceeding towards next steps, including developing information for a final report.

Policy Development: A new initiative on "The Nature of Policy Studies" resulted in the publication of

a report entitled "Policy Studies Supporting Civil Works Missions: Problems and Issues" and a supporting primer entitled "The Nature of Policy Studies Supporting Civil Works Missions: A Primer." Additional policy activity took place in specific program areas such as flood risk management, where issue papers led to proposals for a national levee assessment and closer coordination with the Federal Emergency Management Agency (FEMA).

COLLABORATION AND PARTNERING

The USACE recognizes that Civil Works missions must be carried out in collaboration with multiple partners and stakeholders with differing authorities, capabilities and perspectives. Thus a major IWR focus has been as the unofficial USACE center of expertise for collaboration, partnering and public participation. In FY07 the Corps took steps toward official recognition of that role with funding for a Center for Collaboration, Environmental Conflict Resolution and Participation. In addition, IWR serves as the USACE lead for multiple national partnerships and is committed to developing new technologies, processes and policies to further collaborative planning and partnering.

In FY07 IWR shepherded a review of current practices in environmental conflict resolution and continued the National Cooperative Modeling and Collaborative Planning Demonstration programs with multiple Federal, state, university and non-governmental partners. Of particular note, IWR led the development of an interagency federal initiative on the intersection of computer tools and multi-stakeholder collaborative water resources management processes. As part of this initiative, IWR led an interagency workshop on Computer Aided Dispute Resolution.

IWR represented both USACE and the Office of the Secretary of Defense (OSD) on the Executive Office of the President's National Science and Technology Council Interagency Subcommittee on Water Availability and Quality (SWAQ). IWR actively participated in the development of the SWAQ Strategic Plan for Federal water resources agencies to ensure adequate water availability and quality, culminating in the publication of the report "A Strategy for Federal Science and Technology to Support Water Availability and Quality in the United States", September 2007."

IWR also developed guidance on collaborative planning in support of HQUSACE, led execution of Corps-wide Memoranda of Agreement (MOAs) and

Memorandum of Understanding (MOUs) and engaged the academic community through the Maass-White Visiting Scholars program, the Universities Council on Water Resources (UCOWR) Fellowship Visiting Scholars program, the National Research Council (NRC) Research Associates program, the American Association for the Advancement of Science (AAAS) Science and Technology Policy Fellows program, and the Leo R. Beard Visiting Scholars program (resident at HEC).

National Partnerships: Forming strategic alliances, both through formal agreements and informal working relationships, is becoming a way of doing business in the USACE, government agencies and non-governmental organizations (NGOs). Driving this movement are the complexity and far-reaching impacts of today's water resource problems, juxtaposed with the limited financial and intellectual resources of any single organization. The USACE is increasingly committed to partnerships as a means of accomplishing common goals. In FY07 IWR initiated several new MOAs and MOUs and furthered work on existing agreements.

Natural Resources Conservation Service Partnership: A partnership agreement was signed between the U.S. Department of Agriculture's Natural Resources Conservation Service (NRCS) and the Corps on July 7, 2005. The purpose of the agreement is to promote a long-term working relationship and collaborative effort to improve the management of water and related natural resources under the missions and authorities of the NRCS and USACE. Initially, collaboration focused on three areas: (1) watershed planning and implementation; (2) wetland creation, restoration and enhancement and (3) natural disaster recovery. The agencies agreed to coordinate other programs and activities, including the Wetland Conservation Compliance (Swampbuster) and the Regulatory Program (Section 404 of the Clean Water Act). Accomplishments in FY07 include the development of a partnership brochure, a website, and a draft action plan. Interagency teams have been formed and are working on several of the action items.

U.S. Geological Survey Partnership: Significant activities for the U.S. Geological Survey MOA included senior level meetings addressing streamgaging issues, climate change and water resource issues, coastal and environmental research and collaboration on international activities.

U.S. Bureau of Reclamation Partnership: In June 2006, a meeting was held in Folsom, California between HQUSACE, IWR and Bureau of Reclamation

management to discuss the existing USACE - Bureau of Reclamation (U.S. Department of the Interior) MOA, provide additional definition to the agreement and discuss details of current collaboration projects, the most visible being Folsom Dam. A similar meeting is planned for FY07.

Oak Ridge National Laboratories Partnership: During FY07 IWR continued to implement a 2005 MOU with the U.S. Department of Energy's Oak Ridge National Laboratories and ERDC that centers on energy, security and environmental sustainability. Thrusts of the agreement include joint work on regional energy and water management, transportation modeling, emergency response, homeland security and environmental sustainability.

Other Partnerships: IWR is working closely with Sandia National Laboratories through the National Cooperative Modeling Demonstration Program and is developing an MOU which is expected to be signed in 2008.

IWR represented both the USACE and the Office of the Secretary of Defense (OSD) through participation in the National Science and Technology Council's interagency Subcommittee on Water Availability and Quality (SWAQ) and its Subcommittee on Disaster Reduction. IWR actively participated in the development of the SWAQ Strategic Plan for Federal Research and Development to ensure adequate water availability and quality, (publication title "*A Strategy for Federal Science and Technology to Support Water Availability and Quality in the United States*", September 2007), and is leading development of the resultant interagency Federal Initiative on Collaborative Tools and Processes for U.S. Water Solutions.

Academic and Professional Practice Partnerships

Universities

In FY07, IWR entered into Memoranda for Understanding (MOU) with a number of universities and professional organizations, and made continued progress on other MOUs with additional universities and professional organizations that will be signed in FY08. Key agreements were executed with the University of Arizona, the University of New Hampshire, and the Oregon State University.

These partnerships will facilitate cooperation in research in the areas of integrated water resource management, scientific research, and capacity building in developing countries and countries in

INSTITUTE FOR WATER RESOURCES

transition. Each of the universities with which IWR has entered into MOUs has unique program features that compliment the strengths and talent of the Institute.

The University of Arizona is home to the National Science Foundation's Science and Technology Center for Sustainability of Semi-Arid Hydrology and Riparian Areas (SAHARA), thus allowing the Institute and the University to focus on sustainable development and sound water management policies, particularly in arid and semi-arid climates.

IWR's partnering with the University of New Hampshire's Institute for the Study of Earth, Oceans, and Space, Water Systems Analysis Group which focuses on the understanding of water resources issues on a global scale and the application of technological improvements in water resource management, allows cooperation in the field of global water science, integrated water resources management, and interdisciplinary scientific research and capacity building, particularly in developing and emerging countries and post-disaster nations and regions.

IWR's partnering with the Oregon State University's Institute for Water and Watersheds, which focuses on integrated water resource management, sustainable development, ecological design, ecosystem restoration and environmental conflict resolution, allows for cooperation in numerous areas including, infrastructure development, adaptive management and adaptation to global warming, flood risk management, hydrologic analysis, risk analysis and systems modeling, environmental restoration, ecological design, consensus building, conflict resolution, alternative dispute resolution, and shared vision planning.

Professional Practice Organizations

In FY07 the Institute entered into an MOU with the Environmental and Water Resources Institute (EWRI) of the American Society of Civil Engineers. The MOU will further both organizations' goals of enhancing the use of effective water resources development and management policies, and will establish a long term cooperative effort in the field of integrated water resources development and management, engineering and scientific excellence, and capacity building both in the United States and internationally.

Memoranda of Understanding under development in FY07 and scheduled to be signed in FY08 include

partnerships with the Colorado State University, International School for Water Resources, Department of Civil and Environmental Engineering; the American Water Resources Association, and the Global Water Partnership, an international network of organizations involved in water resources management, established in 1996 by the World Bank, the United Nations Development Program, and the Swedish International Development Agency, and headquartered in Stockholm, Sweden.

FEMA Silver Jackets: Through the Silver Jackets program, managed by IWR, the USACE cooperates with FEMA and other Federal agencies to create Federal interagency teams which engage at the state level to develop and implement solutions to the state's natural hazard priorities. The primary goals of the Silver Jackets program are to leverage information and resources, improve public risk communication through a united effort and to create a mechanism to collaboratively solve issues and implement initiatives. To date, Silver Jackets has initiated pilot programs in Ohio and Indiana. These teams have succeeded not only in improving communication, but also in leveraging resources and programs between Federal agencies. For example, coordination through the Ohio team has enabled the small community of Marietta to acquire detailed mapping of its community at nominal cost by tapping into an ongoing regional watershed study. Through the same Silver Jackets team, an opportunity was discovered to integrate two different programs by utilizing the USACE Planning Assistance to States (PAS) program to provide resources and FEMA's Flood Mitigation Assistance (FMA) program to outline the requirements—resulting in the town gaining eligibility for FEMA flood mitigation funds. Silver Jackets remains engaged in the pilot stage. The program will continue team development on a state by state basis, ultimately establishing an interagency team in every state.

Ocean Action Plan: The USACE is participating in implementation of the President's Ocean Action Plan through integrated networks and partnerships of Federal, state, local, territorial and tribal authorities, the private sector, international partners and ocean communities. In 2007, IWR coordinated USACE participation in regional ocean governance initiatives, co-leading USACE support to the Gulf of Mexico Alliance with ERDC. The Corps is one of thirteen Federal agencies supporting the Governors' Action Plan for Healthy and Resilient Coasts. IWR staff participated in the development and review of material for the West Coast Governors' Ocean Health Agreement, and led USACE participation in the Subcommittee on Management of Ocean Resources

(SIMOR), engaging other USACE staff depending upon the issues raised to the Subcommittee. Through participation on the Joint Subcommittee on Ocean Science and Technology, IWR staff contributed to development of the Ocean Research Priorities Plan and its implementation strategy, and to projecting the need for new ocean research facilities.

National Ocean Service Partnership: The USACE and the National Oceanic and Atmospheric Administration's National Ocean Service (NOS) formed a collaborative partnership as an outgrowth of Ocean Action Plan initiatives, calendar year 2005 post-storm experiences, and recognition of mutually beneficial advances and synergies that could be affected through collaboration. The partnership is leveraging each agency's programs and talents through joint centers for coastal mapping, instrument testing, evaluation and training; improving data sharing capabilities; coordinating vertical datum systems and improving tidal measurement and information; and improving natural hazard risk communication that incorporates consideration of community resilience. In 2007, the partnership initiated leveraging the NOS coastal resiliency initiatives with the Corps Flood Risk Management Program.

Interagency Committee on the Marine Transportation System: The Corps continues coordinating with the Maritime Administration (MARAD), National Oceanic and Atmospheric Administration (NOAA), the Coast Guard and other Federal departments and agencies to support the Committee on the Marine Transportation System (CMTS), which was initiated in July 2005. The Corps' Director of Civil Works was selected as the initial chair of the Coordinating Board for the CMTS and the Assistant Secretary of the Army (Civil Works) was designated as the Department of Defense principal to the CMTS. The Coordinating Board chair rotated to the Administrator of NOAA in 2007 and will rotate to the Maritime Administrator in 2008. IWR provides logistics support and participates on Integrated Action Teams, including leading the team to develop an assessment of the Marine Transportation System. A contract was awarded to DOT's Volpe Center in 2007 to assist with the assessment.

Regional Sediment Management: The USACE has adopted the Regional Sediment Management (RSM) approach in carrying out many of its programs. Sediment management spans the USACE Navigation, Flood and Coastal Storm Damage Reduction, and Ecosystem Restoration missions and responsibilities. The RSM approach implements the watershed perspective and the principles of integrated water

resources management. The USACE applies this perspective and approach as a major stakeholder in many of the Nation's inland and coastal watersheds. In 2007, IWR staff initiated development of guidance on implementing the RSM approach, and facilitated initial support to a Regional Sediment Management Master plan to support the Gulf of Mexico Alliance.

Coastal Engineering Research Board: The CERB provides broad policy guidance and review of plans and requirements for the conduct of research and development in support of coastal engineering and the objectives of the Chief of Engineers. In 2007 IWR supported the Director of Civil Works in organizing the CERB visit to the Rijkswaterstaat in the Netherlands and to meet with other European Union countries regarding flood risk management and coastal protection, and reporting to the Chief of Engineers on their findings.

Environmental Advisory Board: IWR has led the USACE technical team supporting the Chief of Engineer's Environmental Advisory Board (EAB) since FY04. In FY07, the EAB completed a focus on an overarching theme of ecosystem restoration through water resources management. Out of those themes, but particularly the adaptive management theme, the EAB recommended to the Chief that the Corps form and lead a National Center for Ecosystem Restoration that involved collaboration with leading ecosystem restoration experts among universities and Federal and other agencies. In FY07 the EAB also concentrated on the continued need for Regulatory Program improvements and USACE regulatory jurisdiction issues associated with court cases, including the Rapanos and Carabell U.S. Supreme Court decisions. Two public meetings were held in FY2007: December 2006 in New Orleans and July 2007 in Washington, D.C.

Inland Waterways Users Board: IWR continued its technical and administrative support of the Inland Waterways Users Board (IWUB) in FY07, including the analysis of and reporting on the financial status and capability of the Inland Waterway Trust Fund, assistance with drafting of the IWUB Annual Report to Congress, evaluation of candidates nominated for Board membership and the administration of three IWUB meetings including No. 53 on November 17, 2006 in Pittsburgh, PA, No. 54 on March 14, 2007 in New Orleans, LA, and No. 55 on July 31, 2007 in Louisville, KY.

Collaborative Planning: The National Cooperative Modeling and Collaborative Planning and Management Demonstration programs work together

to develop, test and demonstrate collaborative modeling tools and concepts. Although IWR has a long history of applying collaborative modeling tools through its signature Shared Vision Planning (SVP) process, IWR is developing new conceptual and methodological foundations as well as documenting, vetting and publicizing advances and experiences.

FY07 activities included collaborative development of an integrated system model to facilitate a common understanding of linkages between reservoir operations, water quality, ecology and economics on Oregon's Willamette River; initiatives to support the USACE Section 404 regulatory role and state water planning processes on the James River in Virginia and on the front range of Colorado; initiation of work with the Nature Conservancy and the Sustainable Rivers Project on the Connecticut River, and development of an MOA with the California Department of Water Resources to provide assistance in using the Shared Vision Planning approach to engage stakeholders in advance of its 2009 water plan update.

A major event during FY07 was the convening of a September 2007 workshop on Computer Aided Dispute Resolution that brought nine federal agencies, nonprofit organizations, states, irrigation interests and the private sector together to share experiences on the use of collaborative computer modeling in solving water resources disputes. The proceedings of the workshop entitled "*Computer Aided Dispute Resolution: Proceedings from the CADRe Workshop, Albuquerque, New Mexico, September 13-14, 2007*" were published as [IWR Report 07-R-6](#).

The Nature Conservancy Sustainable Rivers Project: Begun in July 2002, the Sustainable Rivers Project (SRP) is a nationwide partnership between the USACE and The Nature Conservancy (TNC) to improve the integrity and life of rivers by changing the operations of USACE dams while maintaining or enhancing project benefits. The SRP is working towards this goal through a combination of partnered activities, including demonstration projects, training, software development and a staff exchange that assigned an engineer from HEC to the SRP through an Intergovernmental Personnel Act (IPA) agreement. February 2006 concluded the two-year exchange that was instrumental in promoting the partnership, providing direct support to project sites and initiating a joint software development project and joint training program. As of 2006, joint HEC/TNC training has been provided to 219 students, including representatives from seven different agencies, nearly 90% of USACE districts and all eight USACE divisions. Training agendas in 2006 included a series

of increasingly difficult topics and workshops in which course participants gained experience using six different software tools, including the new HEC Regime Prescription Tool (HEC-RPT). A product of the first software collaboration between the USACE and TNC, HEC-RPT is designed to help groups of scientists, engineers and water managers access hydrologic data and draft flow recommendations while they formulate different ways to manage rivers. HEC plans to explore other emerging partnership opportunities such as removal of small dams and river-floodplain reconnections.

National Flood Risk Management Program: In May of 2006 in an IWR-led effort, the USACE established the National Flood Risk Management Program for the purpose of integrating and synchronizing USACE flood risk management programs and activities both internally and with counterpart activities of FEMA and other Federal, state, regional and local agencies. Its vision is to lead collaborative, comprehensive and sustainable national flood risk management to protect the public and reduce flood damages to our country.

Since its inception, the National Flood Risk Management Program continues to build on coordination work that has already taken place between USACE and FEMA to ensure consistent communication to the public on FEMA's Flood Mapping Modernization (MapMod) Program and related flood risk issues and to leverage resources when working on similar activities or within the same geographic area. Some of the specific accomplishments that have taken place under the umbrella of the National Flood Risk Management Program include:

- Conducting an inventory of 13,000 miles of levees nationwide that are part of a USACE project or are inspected as part of a USACE program and developing a methodology for risk assessments of levee systems.
- Cooperating with FEMA to notify owners of levees that pose a threat to public safety based on past inspection results.
- Working with communities to identify options to remediate deficient levees or otherwise address the resulting public safety hazards.
- Providing ongoing support of both FEMA regions and levee owners at the USACE district level by providing data for the flood mapping studies and information to communities affected by efforts to update

flood maps under FEMA's MapMod program.

- Collaborating with FEMA to develop levee certification guidance for USACE District offices and FEMA regions.
- Developing a consistent inspection methodology and procedures to strengthen the USACE Inspection of Completed Works program under which USACE constructed levees are inspected.
- Continuing to coordinate quarterly meetings of USACE and FEMA leadership as part of the Interagency Flood Risk Management Committee to ensure that the two agencies maintain complementary policies and practices as the FEMA MapMod Program and USACE Flood Risk Management Program progress.
- Cooperating with FEMA and other Federal agencies through the Silver Jackets program to create interagency teams at the state level to develop and implement solutions to state natural hazard priorities.
- Supporting and participating in policy research and discussion forums to develop policy proposals for improving national flood risk management.
- Working with FEMA to jointly develop a risk communications plan to convey the purpose and specifics of ongoing activities to improve levee safety, including MapMod, a strengthened Inspection of Completed Works program and the levee inventory and risk assessment.

IWR Visiting Scholar Programs: Each Visiting Scholar program seeks to bring the foremost water resources experts from academia, private industry and other agencies and laboratories to residence at IWR or HEC for periods of six months to one year. Visiting scholars are expected to infuse new energy, perspectives and ideas to the IWR program, while the practical work environment at IWR and HEC provides a stimulating context for mutual exploration of potential advances in hydrologic engineering and planning analysis.

FY07 marked the sixth year for the Institute's Maass - White Visiting Scholar program, established in 2001 in recognition of the contributions of, and the Institute's intellectual alignment with, two of the founders of modern water resources analytical theory—Professors Arthur Maass of Harvard University, and Gilbert White of the University of Colorado. FY07 was the fourth year for two other designated visiting scholar positions, both established in 2004: the first a

partnership with the Universities Council on Water Resources (UCOWR) and the second, HEC's Leo R. Beard Visiting Scholar program, named after the founding director of HEC. FY06 marked the initiation of two new post-doctoral Fellows programs: the National Research Council (NRC) Research Associateship and the American Association for the Advancement of Science (AAAS) Science and Technology Policy Fellows program. IWR and HEC underwent a rigorous certification process by independent reviewers in order to qualify for these two prestigious programs.

In FY07, Dr. Yacov Haimes, the Lawrence R. Quarles Professor of Engineering at the School of Engineering and Applied Science, University of Virginia was named as the Maass-White Fellow for 2007-2008. He will be engaged in risk analysis and risk informed decision making as part of the Actions for Change initiative.

Dr. Paul Kirshen of the Department of Civil and Environmental Engineering, Tufts University was named as the 2007 – 2009 Universities Council on Water Resources Fellowship Visiting Scholar. Dr. Kirshen's research will be in the field of Shared Vision Planning.

Dr. David W. Watkins, Jr. of the Department of Civil and Environmental Engineering at the Michigan Technological University was named as the Leo R. Beard Visiting Scholar at HEC. Dr. Watkins' research will focus on risk analysis and decision making under uncertainty.

Previous IWR visiting scholars have included:

- Maass-White Visiting Scholars: Dr. Daniel (Pete) Locks, Cornell University (2001-2002), Dr. Peter Rogers, Harvard University (2003-2004), Dr. Leonard Shabman, Resources for the Future, (2004-2006), and Dr. Gerald Galloway, University of Maryland (2006-2007).
- UCOWR Fellow: Dr. Bruce Hooper, Southern Illinois University (2004-2005).
- Leo R. Beard Visiting Scholar: Mr. Tony Thomas, founder and president of Mobile Boundary Hydraulics (2004), followed by Professor Jerry Steiner, Cornell University (2005).
- IWR NRC Research Associate: The first IWR NRC Fellow was Dr. Peter Rogers, Colorado State University (2006), while HEC selected Dr. Jason Giovanettone, Duke University (2006).

- AAAS Fellow: Dr. Alexey Voinov, University of Vermont, was the 2006 AAAS Fellow.

As part of Dr. Leonard Shabman's work at IWR, he along with Dr. Kurt Stephenson of the Virginia Polytechnic Institute, co-authored a paper entitled "*Environmental Valuation and Decision Making for Water Project Investment and Operations: Lessons from the FERC Experience*", published in March 2007 as IWR Report [2007-SVP-01](#).

WATER RESOURCES METHODS AND MODELS

Two major IWR focus areas are (1) the evaluation of engineering, economic, social, institutional and environmental needs and, to address those needs, (2) the development, transfer and application of improved water resources analytical techniques, models and information systems. The goal is to produce state-of-the-art multi-purpose planning and hydrologic engineering methods and models to support investment decisions. This is accomplished by means of programs in research, training, planning analysis and technical assistance.

Planning Models Improvement Program: HQUSACE guidance EC 1105-2-407, "Planning Models Improvement Program: Model Certification", published in 2005 prescribed a corporate business process and policy for the development, certification, training and on-going support for planning models, with the certification process based on internal and external peer support and review and with the responsibility for establishing priorities and managing the certification process residing with the planning centers of expertise in coordination with the findings of the Strategic Engineering and Technology Initiative. In FY05 and FY06 IWR, with input from other Corps laboratories and the planning centers of expertise, developed protocols for model certification that include the processes and criteria to be used for certifying planning models. In FY 07, IWR initiated the certification process for two legacy models widely used by Corps planners, HEC-FDA and IWR Planning Suite. HEC-FDA, developed by the Hydrologic Engineering Center, is a frequency-based model for the estimation of inundation damages. IWR Planning Suite, developed by IWR NCR, is a model designed to assist Corps planners in the formulation and evaluation of ecosystem restoration projects using cost effectiveness and incremental cost techniques.

Navigation Economic Technologies Research: For more than a century the USACE has played a key role in maintaining a robust national economy by ensuring that farmers, manufacturers and businesses can easily transport goods up and down our Nation's rivers and out to sea via coastal ports. The Navigation Economic Technologies (NETS) Research Program supports the navigation mission by developing state-of-the-art, credible, independently verified economic models, tools and techniques to be used by USACE field planners in informing investment decision making at all levels of the agency. The knowledge and tools developed by the NETS research program are based on reviews of economic transportation and market theory, current best practices both within and outside of the USACE; data needs and availability; and peer recommendations.

In FY07, the centerpiece of NETS research was a suite of simulation models that included:

- The Global Grain forecasting model, modified in response to independent peer review comments.
- A repeat of the Mid-America Grain study, expanded to include non-grain waterway freight. Findings have been incorporated into a new annual "Survey Model" designed to respond to the criticisms made by the National Academy of Sciences to the structure and inputs of previous models. It has been evaluated and certificated by the Planning Center of Expertise for Inland Navigation.
- Model certification has begun on the HarborSym channel widening model. Prototypes for suite modules have been developed for the Navigation System Simulation (NaSS).
- Work has begun to incorporate NETS research findings into legacy models. In conjunction with the Oak Ridge National Laboratory, NETS is working with the Planning Center of Expertise for Inland Navigation to incorporate "shipper response" into the Ohio River Navigation Investment Model (ORNIM). In a related effort, NETS is working with the Planning Center of Expertise for Inland Navigation to conduct surveys to estimate the shape of the shipper response curves on the Ohio River, needed inputs for the modified version of ORNIM.

Looking forward to 2008, NETS is transitioning from research to practice. Several NETS tools will be certified by the USACE planning centers of expertise for use in current navigation studies. The HarborSym

channel widening model is being used in field study and the NETS team is extending its functionality to include channel deepening analysis. The NETS team continues to focus on outreach and communications via the NETS web site www.nets.iwr.usace.army.mil, the NETS Newsletter and participation at conferences around the world.

Environmental Sustainability: The Environmental Sustainability Project, managed by Dr. Richard Cole, includes activities that pertain to the implementation of the Environmental Operating Principles (EOP). Development of a framework for achieving environmental sustainability has been completed in draft and is in internal review for IWR publication. An assessment of the condition of freshwater biodiversity at Federal water resources projects has been reviewed and awaits final approval for publication. A new metric for measuring the benefits from ecosystem restoration projects has been developed and two technical reports are in final review for publication through ERDC. A third technical report, nearing completion, compares the new metric with other metrics now used for ecosystem restoration benefits estimation. In addition, a technical note and journal article on the metric are in progress. A study addressing the need for a more clearly stated ecosystem restoration objective for the Civil Works program is also underway.

IWR Planning Suite: In January 2007, the Institute deployed IWR Planning Suite, Version 1.05, a water resources investment decision-support tool that performs cost-effectiveness and incremental cost analyses associated with the formulation and evaluation of planning alternatives that produce non-monetary or a combination of monetary and non-monetary outputs. Originally designed to assist with the development and comparison of alternative plans for ecosystem restoration and watershed planning studies, the program can also be applied to a wide variety of integrated water resources planning and management problems by identifying which plans are the best financial investments, then displaying and comparing the effects of each plan on a range of decision variables. An IWR Planning Suite User's Guide was published to accompany the software. Training in the software was delivered to HQUSACE, OASA (CW) and Galveston District. Two new modules were developed and beta-tested that can be "plugged in" to IWR Planning Suite: the "Multi-Criteria Decision Analysis" module, and the "Annualizer" module (the latter annualizes cost and outputs based on user-provided implementation costs, discount rate, periodic operation and maintenance

costs, period of analysis, benefits streams, ecological response rates, etc). These modules will be deployed in 2008. Certification of IWR Planning Suite in compliance with the requirements of the Planning Model Improvement Program (PMIP) guidance is currently in progress.

Transportation Systems: The Transportation Systems Program supports HQUSACE and USACE district offices in accomplishing waterborne navigation project planning and evaluation responsibilities through the provision of (1) uniform and consistent maritime transportation data concerning costs of operation and replacement of foreign-flag and domestic commercial vessels and (2) comprehensive statistics on the composition and physical parameters of the world deep draft fleet and the domestic shallow-draft inland fleet. Macro-level world trade and cargo flow forecasts are also provided. Future work includes updating of vessel operating costs for both the deep and shallow-draft fleets with an increase in statistical samples and the number of ship types covered compared to previous years; world trade and commodity flow forecasts; distribution of updated materials and statistics from various maritime industry data subscriptions; update of general reporting statistics for the inland navigation system and updated subscriptions for barge, rail and truck alternative transportation modal models. Supporting efforts will include a first edition of the vessel operating cost primer, enhancements to the estimation of vessel bunkering costs, and an investigation of long-term normalized rates of return on hull assets as an improvement on vessel operating cost evaluation.

Flood Damage Data: The Flood Damage Data Collection program is intended to produce generic relationships for computing expected annual flood losses and tools for the collection and management of floodplain inventory data. In FY07, IWR completed the development of a geospatial floodplain inventory tool for residential, business and public property. IWR-GeoFIT had its first development in New Orleans District. IWR also completed a post-Katrina data collection effort for the New Orleans Metropolitan area. Work was initiated on cooperation with FEMA on benefit-cost analysis procedures. Damage functions were computed for vehicles and temporary relocation.

System-Wide Water Resources Research: The System-Wide Water Resources Research Program (SWWRP), a joint effort between IWR (led by HEC) and ERDC laboratories, is focused on expanding research activities to the "System Wide" perspective, reflecting a concerted effort by USACE to follow

concepts of sustainable development in a watershed context. Funding from SWWRP supports the development of multiple software packages that are widely used throughout the USACE and the professional engineering community, including HEC-HMS (Hydrologic Modeling System), HEC-RAS (River Analysis System), HEC-WAT (Watershed Analysis System), HEC-PRM (Prescriptive Reservoir Model), and HEC-EFM (Ecosystem Functions Model).

Flood and Coastal Storm Damage Reduction Research (FCSDR): Work funded through the FCSDR research and development program continued in FY07. The FCSDR program is a collaborative effort between IWR, ERDC and other entities. IWR is responsible for three programs within the FCSDR, H&H and Risk and Uncertainty both led by IWR - HEC in Davis, California, and Alternatives Analysis and Decision Making led by IWR - NCR, Alexandria, VA. FCSDR looks at methods to improve the analysis of flood damage and flood damage reduction techniques. It concentrates on the development of tools relating to modeling of flood damage and flood damage reduction techniques.

IWR-HEC H&H and Risk and Uncertainty: Funds from FCSDR support the development of HEC-WAT, HEC-ResSIM, HEC-DSSVue, HEC-SSP, HEC-FDA, HEC-FIA, HEC-GeoRAS, and HEC-GeoHMS. Additional funds are provided for research topics including, flood frequency analyses, extreme flood events, groundwater and surface water interaction and real-time forecasting. Several research related activities were initiated in FY07 including the investigation into the development of the next generation of HEC-FDA. This proposal stemmed from a February workshop for considering the future of flood risk management and development of a new version of a flood damage analysis tool. This new tool could include event sampling, the ability to do scenarios analysis, structure-by-structure analysis, cost analysis and agricultural damage analysis all in a systems context. This new tool will accommodate those recommendations that the Corps concurred with from the National Research Council 2000 report on the Corps implementation of risk analysis for flood damage reduction and it would also aid in implementing the Chief of Engineers Actions for Change initiative.

HEC also initiated modification of two Engineer Manuals, EM 1110-2-1413, "Engineering and Design – Hydrologic Analysis of Interior Areas" and EM 1110-2-1619, "Engineering and Design – Risk Based

Analysis for Flood Damage Reduction Studies" via the Guidance Update Management Program (GUMP) to include materials generated from research actions.

Additionally, HEC led the PDT for creating the new Engineer Circular (EC) addressing levee certification for the National Flood Insurance Program (NFIP). This EC will supplement and clarify existing policy, procedural and technical guidance; provide an overview of documentation requirements; outline an Independent Technical Review (ITR) process; and summarize authority and funding mechanisms.

Related to the EC, HEC has provided input to the FEMA AR Zone evaluations for the Natomas area near Sacramento, CA and for parishes in and around New Orleans. An AR Zone establishes a flood zone for flood control restoration areas on NFIP maps. It establishes minimum floodplain management restrictions and requires protection from the 3% flood event.

IWR-NCR Alternatives Analysis and Decision Making (AA&DM): The AA&DM in the old structure of ERDC, was a stand-alone program aimed at addressing decision making criteria, such as social impacts and economics. It evolved into a methods approach to address a growing number of concerns, including how to formulate and evaluate projects that do not have an economic basis or justification for being. Ecosystem restoration projects, the newest mission of the Corps of Engineers, falls into this category. In the AA&DM program there are several work units aimed at this objective.

The "Catalog of Management Measures" is an illustrated set of management measures which was created to better enable planners to consider a wider range of alternatives, including non-structural for ecosystem restoration projects. The catalog has been digitized and posted on the IWR website to promote greater access. The catalog is available at <http://www.iwr.usace.army.mil/inside/products/pub/MMDL/FLD/>.

The IWR Planning Suite was initially a tool for conducting cost effectiveness and incremental cost analysis on restoration projects. It guided planners and decision makers to the alternative plans that provided the greatest amount of output for the least cost. It has grown to include plan formulation assistance as well as accommodating a tradeoff analysis tool known as Multi-Criteria Decision Making or "MCDM." The next effort will attempt to link environmental values to the output discussions.

A new program was initiated in FY07, entitled Estimating Flood Damage to Roads caused by severe and prolonged flooding events. A model will be developed to link the expected damages to roads based on the severity of a given flood.

The Collaborative Planning work unit looked at a number of case studies across the Corps of Engineers, attempting to identify characteristics of successful collaboration among Corps offices and their local and regional partners. The second phase attempted to identify barriers to successful collaborative planning.

The project, titled “Theoretical Underpinnings of Other Social Effects,” was aimed at identify other social effects and how they can or should influence the decision making process. The funding for this effort was leveraged with ongoing IWR work and with ERDC R&D funding.

Planning Methodologies:

National Economic Development Manuals: IWR is in the process of updating the National Economic Development (NED) Manuals series, originally published between 1987 and 1991. The manuals are important basic references for economists and others involved in planning and analysis of Federal water resource projects. The manuals discuss the principles and concepts associated with NED benefits and provide detailed procedures to measure and calculate benefits. The updated manuals will be exclusively web-based to increase accessibility for field personnel; facilitate the maintenance and update of the manuals; improve the efficiency and effectiveness of providing up-to-date information to the field; and be responsive to a diverse audience. The web-based interactive manuals will provide links to relevant and timely guidance, data sources and case examples from USACE and non-USACE sources. The framework for the web-based manuals was completed in FY06. The Flood Damage Reduction manual is complete and available for use. Coastal Storm Damage and Deep Draft Navigation manuals are under development and are scheduled to be completed in FY08.

Collaborative Handbook: In FY07, IWR published IWR Report [07-R-2](#), “*Project Planning in Collaboration with Government Entities, Practical Approaches.*” This handbook is an introduction to the concept of collaboration as it applies to problem solving with Federal, state, and local governmental agencies. The handbook addresses the concept of the “National Interest Plan” which embraces a broader approach to problem solving by incorporating elements that address traditional Corps missions and

also elements that have national importance as expressed in the missions of other collaborating governmental agencies. This handbook explores ways that the Corps District planner can identify opportunities to collaborate throughout all phases of the planning process by incorporating into the formulation of plans all four evaluation accounts, including regional economic development and other social effects, as described in the Principles and Guidelines, 1983. The concept of net beneficial effects is discussed along with how trade-off analysis can be useful in identifying a National Interest Plan.

Other Social Effects (OSE) Handbook: EC 1105-2-409, “Planning in a Collaborative Environment” reemphasizes the importance of fully considering the Other Social Effects (OSE) and Regional Economic Development (RED) accounts in project development, evaluation and decision making. The OSE handbook provides field analysts with the framework and tools they need to perform an OSE analysis. The handbook includes a framework and principles for OSE analysis; tools for performing analyses and examples by business line. The importance of considering OSE throughout the planning process is emphasized by organizing the handbook along the six planning steps. The OSE handbook is the third item produced addressing the OSE account. Previous reports on this subject include an IWR white paper entitled “*Review of Guidance and Procedures for Regional Economic Development and Other Social Effects*”, dated August, 2006 and a research report entitled “*Theoretical Underpinnings of the OSE Account*” March 2007 http://www.usace.army.mil/cw/cecw-cp/psa/f_and_e/theo_under_aug07.pdf

Regional Economic Development Handbook: IWR is in the process of finalizing a handbook on Regional Economic Development (RED). The need to perform RED has grown in recent years given the renewed emphasis in EC 1105-2-409, “Planning in a Collaborative Environment” on the consideration of all four accounts (National Economic Development (NED), Environmental Quality (EQ), RED, and Other Social Effects (OSE)). There is limited experience and expertise in RED analysis throughout the Corps. This handbook will provide valuable tools and education in the use of RED analysis. It includes discussion of RED for each of the Corps' business lines. Consideration of RED impacts in the planning process will result in more comprehensive accounting of project contributions and effects.

Multi-Objective Planning Manual: In response to ER1105-2-100 (“Planning Guidance Notebook”),

EC1105-2-404 (“Planning Civil Works Projects Under the Environmental Operating Principles”) and EC1105-2-409 (“Planning in a Collaborative Environment”), the Corps has been increasingly encouraged to formulate projects having multiple purposes. Since few Districts have performed true multi-purpose planning, IWR prepared this manual to educate planners how to perform this more complex type of decision making. A draft version of this manual is currently under review.

Four Accounts White Paper: A draft white paper entitled “Issues and Applications in Formulation and Evaluation Considering the Four Principles and Guidelines Accounts” was written and circulated for review within IWR and the USACE Planning Community of Practice. The paper highlights the challenges and potential approaches for considering the four accounts in project planning while also discussing the advantages and disadvantages of various formulation strategies. Additional discussion points such as measurement tools and portfolio management in the four account context are also included in the white paper.

Quality of Life White Paper: The Corps uses four accounts, National Economic Development (NED), Environmental Quality (EQ), Regional Economic Development (RED) and Other Social Effects (OSE) to evaluate potential projects. In the last 20 years, the NED account has been the only required account. EC 1105-2-409, “Planning in a Collaborative Environment” emphasizes the need to consider all four accounts and the values which they represent. Quality of Life is a possible construct to display and evaluate multi-dimensional values in the evaluation process. A white paper has been completed which explores Quality of Life indices and their “fitness for purpose” as an additional metric for Corps’ project evaluations.

NexGen Software: HEC continued to enhance many software products and introduce new products. Released in FY07 were:

- HEC-HMS, Hydrologic Modeling Systems, version 3.1 includes several new features and improvements to version 3.0. The companion GIS utility package (HEC-GeoHMS) continues to be updated and is compatible with ArcGIS 9.x versions.
- HEC-RAS, River Analysis System, beta version 4.0. Additional features include water quality temperature modeling, sediment transport, gate rules and modeling of the Katrina event. The companion GIS utility

package (HEC-GeoRAS) continues to be updated and is compatible with ArcGIS 9.x versions.

- HEC-ResSim, Reservoir Simulation Model, version 3.0. New features with this version include new and improved outlet capabilities, operation options, and data management and analysis features.
- HEC-RPT, Regime Prescription Tool, Version 1.1. Enhancements and bug fixes were made to version 1.0 of the RPT. The RPT assists decision makers as they define competing flow recommendations. The tool allows visualization of large amounts of flow data and helps define consolidated flow recommendations. The ultimate goal is to combine it with the HEC-ResSim software to enhance planning and real-time operational decision making.

More information about these software packages and other HEC software can be found on HEC’s website, <http://www.hec.usace.army.mil>.

FY07 also saw improvements to HEC-FDA, the major flood damage and risk analysis software package and HEC-FIA, Flood Impact Analysis. FY08 will see release of HEC-EFM (Ecosystem Function Model), and a beta version of the new HEC-WAT, Watershed Analysis Tool (which will include HMS, RAS, SSP, ResSim and FIA software) and HEC-SSP, the new Statistical Software Package that will replace the multiple DOS based statistical applications.

In FY07, HEC initiated the generation of Economy Act based MOA’s with Sonoma County (CA) Water Agency and South Florida Water Management District.

Both of these agreements will be for specific additions to HEC software that provides capabilities for these agencies. ERDC - Coastal and Hydraulics Laboratory and HEC have drafted a proposal to integrate HEC-ResSim and CEQUAL-W2 for modeling of water-quality constraints on the operations of one or more reservoirs. HEC and the USGS, in association with IHE-Delft, are working together to integrate HEC-RAS and the USGS MODFLOW software. This association will continue in 2008.

INTEGRATED CIVIL WORKS SYSTEMS

Performance based budgeting, performance measurement and program assessment are increasingly important. In response, IWR created a corporate data

warehouse of financial and inventory data, lock characteristics, navigation project profiles, OMBIL outputs, waterborne commerce, lock performance, hydropower, recreation, water supply, National Recreation Reservation System and environmental stewardship data. Data from these sources is linked, integrated and combined to generate performance measures, which are then used in the budget process.

OMBIL: The Operations and Maintenance Business Information Link (OMBIL) Plus, a centralized performance management information system, encompasses the Civil Works business lines of navigation, hydropower, recreation, environmental compliance, environmental stewardship, water supply and regulatory. The OMBIL decision support system distributes data to support a variety of Corps management initiatives, performance-based budgeting and Federal and public data requirements.

In support of the Civil Works business performance measurements, the Navigation Data Center (NDC) extracts expenditure data from the USACE financial management system (CEFMS) and combines it with business output data to generate efficiency and effectiveness measurements, including submissions to the Office of Management and Budget. NDC data supports and is a source of information and data used in the Corps "*Value to the Nation*" publications and the Federal government's recreation access site: <http://www.recreation.gov>. Navigation data is also integrated with CorpsMap, providing an intranet web-based GIS interface. All of NDC's publicly available navigation and water transportation data is available at www.ndc.iwr.usace.army.mil or on its annual CD-ROM.

ORM 2.0: IWR has completed development and deployment of OMBIL Regulatory Module Version 2 (ORM 2.0). ORM 2.0 is a web-based geospatial database application for tracking and managing all aspects of the Corps regulatory process. ORM 2.0 was developed using a unique combination of Corps in-house expertise and contract support. ORM 2.0 supports a consistent national business process for the regulatory program resulting in consistent tracking and reporting of program performance. ORM 2.0 integrates with USACE district enterprise geographic information systems and other federal and state agencies. ORM 2.0 provides the foundation for watershed based decision making in the Corps regulatory program.

CWMS: The Corps Water Management System (CWMS) is a comprehensive data acquisition and hydrologic modeling system for short-term decision

support of water control operations in real time. CWMS supports field-level decision making within the Corps water management mission. It embodies data acquisition, validation, transformation and management; forecasting, simulation and decision support analysis; and information dissemination. The first version of CWMS was released in 2002. CWMS has been updated at roughly annual intervals at the thirty plus Corps offices with water control management responsibilities. Improvements to the system continue via a field-prioritized betterments program. Version 1.5 was released in FY07. Version 2.0, which is scheduled to be released in the summer of 2008, will include major revisions to the basic database structures, allowing water control users more direct access to their data and enabling them to make more effective use of the features inherent in the commercial Oracle database at the center of CWMS. A public release of the modeling component of CWMS, HEC-RTS (Real Time Simulation) is scheduled for release at the end of calendar year 2008. Information about CWMS and other HEC software is available on the HEC web site www.hec.usace.army.mil/cwms/.

WATER RESOURCES TRAINING AND EDUCATION

The Institute for Water Resources, including HEC, has always been a leader in innovation within the Corps of Engineers family. IWR has been responsible for developing techniques and approaches for economic analysis, risk analysis, planning methodologies, public involvement, conflict dispute resolution, water conservation and other topic areas. HEC, through the development of hydraulic, hydrologic and planning analysis methods and models, has built a reputation recognized throughout the world in the fields of hydraulics and hydrology. Over the course of their existence, both IWR and HEC have made considerable effort to build appropriate training vehicles for the instruction in the use of the various tools they have developed. As a result, each office routinely offers eight to twelve courses per year through the Proponent-Sponsored Engineer Corps Training (PROSPECT) program and/or through other training venues, such as workshops and seminars.

PROSPECT Program and Specialty Workshops: IWR continued the USACE Proponent-Sponsored Engineer Corps Training (PROSPECT) program in 2007 by presenting 27 week-long courses (fifteen led by the IWR-NCR and twelve by HEC). The PROSPECT courses covered a wide range of Civil Works water resources topics: Public Involvement

INSTITUTE FOR WATER RESOURCES

and Teaming in Planning; Public Involvement–Communications; Regulatory for New Regulators; Regulatory – Procedural Issues; Regulatory – Decision-Making; Regulatory Executive Seminar; Hydrologic and Hydraulic Engineering; Water Resources Planning; Ecosystem Restoration; Flood Risk Management; Collaborative Planning; and Plan Formulation. The specialty workshops often used pieces of the PROSPECT training courses but generally, the specialty workshops were built specifically for the requesting office and often included topics outside of the normal PROSPECT training. IWR is committed to technology transfer and the dissemination of its tools, processes and procedures. The organization and staff are committed to provide assistance in using our tools, through workshops, telephone consultation or whatever may be necessary.

IWR-NCR assumed responsibility for several of the Planners Core Curriculum (PCC) courses in FY07. IWR staff worked with field instructors to present three of the courses as they were originally created. These included Collaborative Planning, Environmental Considerations in Planning, and Plan Formulation. In addition IWR presented the following classes: Planning for Ecosystem Restoration, a course designed to teach the planning process in the approach to ecosystem restoration projects, with considerable focus on the planning process and decision making. Other IWR courses included Risk Analysis - Water Resources Planning; Conflict Management and Dispute Resolution taught primarily by contractors; Public Involvement - Communications, again taught by contractors; Regulatory I - New Regulators; Regulatory IIA - Procedural Issues; and Regulatory IIB - Decision Making, all of which were taught by Corps regulators from across the country. In addition to the IWR sponsored courses, IWR staff members are active members in a number of other PROSPECT courses, teaching special topics such as Cost Effectiveness and Incremental Cost Analysis (IWR-PLAN), Economics, Forecasting, Risk Analysis, Environmental Benefits, etc.

In addition to the aforementioned training, IWR is also responsible for managing the Corps Planning Associates (PA) program, which is designed to be comprehensive training to build future leaders in the planning community of practice. The program is a series of interrupted one, two and three week sessions interspersed with trips back to the home district to keep up with the workload. Students are committed to keeping their work at home moving while participating in the program.

During FY07 IWR-NCR held a one week workshop on Risk Analysis as part of Actions for Change risk education and training.

IWR is now embarking on a new venture, that of a Center for International Training in Water Resources Management. IWR has been nominated by the U. S. Government, through the Department of the Army, to become a UNESCO Water Related Center. Should this nomination be approved, IWR will become the UNESCO Center for Integrated Water Resources Planning and Management. IWR-NCR and HEC will be heavily involved in promoting and staffing this program. In anticipation of this coming to pass, IWR-NCR has constructed a new classroom in the Casey Building to accommodate future classes of national and international students.

HEC conducted ecosystem oriented training courses such as “Water and the Watershed” and “Hydrologic Analysis for Ecosystem Restoration” as well as a full menu of hydrologic engineering and planning analysis topics, including courses on HEC-ResSim, Hydrologic Engineering Applications for GIS, Statistical Methods in Hydrology, H&H for Dam Safety Studies, CWMS Modeling for Real-time Water Management, Sediment Transport Analysis with HEC-RAS, Risk Analysis for Flood Damage Reduction Projects, and advanced courses in unsteady flow with HES-RAS and HEC-HMS.

A one week specialized training course was provided to Exponent Inc., an American company partnering with two Italian firms on executing water resources projects for the Iraq Foundation NGO and the Iraqi Ministry of Water Resources. The training was tailored to present advanced features of HEC-HMS, HEC-ResSim, and HEC-RAS computer programs.

HEC also hosted an international workshop organized by U.S. Bureau of Reclamation on the status of models for simulation of dam breach mechanics.

As part of the Combined Joint Task Force-Horn of Africa host nation agreement, HEC presented specialized training in water resource engineering. The training emphasized stream hydraulics and groundwater hydrology and took place in Kenya (4 days) and Ethiopia (6 days).

HEC also presented a basic HEC-RAS workshop to the state of Missouri Department of Transportation. HEC presented a workshop on Hydrology and Hydraulics for Dam Safety Studies to Honolulu District, state employees and consultants. A one-day

short course on HEC-EFM was conducted for planning and engineering staff of Fort Worth District.

The first of three HEC specialized workshops was conducted in Jordan as part of a capacity development program for the Iraqi Ministry of Water Resources engineering staff. The capacity development program is focusing on the use of HEC-DSSVue and HEC-ResSim computer programs in a water resources planning study that the Ministry is undertaking.

The training course "Unsteady Flow Analysis Using HEC-RAS" was presented to Maricopa County in Phoenix, AZ and to the National Weather Service in Davis, CA. This course was intended to provide participants with the knowledge to effectively utilize the HEC-RAS software to analyze hydraulic conditions that require one-dimensional unsteady flow modeling.

At the USGS Idaho Water Science Center in Boise, HEC trained six engineers from the Iraqi Ministry of Water Resources in the use of HEC-DSS for data management, and provided consulting regarding their telemetry system and database designs.

HEC provided training in Kabul, Afghanistan that consisted of Hydrology (Introduction to HMS), Hydraulics (Introduction to RAS), and Reservoir operations (Introduction to ResSim) and included an explanation of the model HEC developed for the Helmand River in Afghanistan.

HEC assisted with a one-day training seminar at the 10th International River Symposium held in Brisbane, Australia. As part of this seminar, HEC-RPT was presented and used in a workshop by 44 students from 12 different countries.

Planning Excellence Program: Throughout FY07, IWR provided managerial and technical support to the Civil Works Planning Community of Practice (CoP) in the execution of the Planning Excellence Program.

This included the management of the Planning Associates (PA) program and conduct of the three-week "Washington DC Experience" module for the FY07 class. The goal of the PA program is to develop planning leaders who can manage complex planning studies that lead to quality decision documents and who will provide water resources technical and professional leadership in the future.

IWR, in coordination with HQUSACE, is responsible for the implementation of the program, including

setting up the criteria for selection of candidates, development and delivery of training sessions and financial management and logistical support.

IWR also provided support to the local delivery of selected Planning Core Curriculum courses by the Corps MSCs. These seven courses provide the basic, full-performance training needed by entry level planners across the USACE as the means to accelerate their progress to the journeyman stage of their career development. These courses include: Civil Works Orientation, Planning Principles and Procedures, Environmental Considerations, Economic Analysis, H&H Considerations, Plan Formulation and Public Involvement and Team Planning.

Advanced Degree Program in Integrated Water Resources Management

The USACE strives to provide optimum training and development opportunities in order to assure maximum efficiency of members of its workforce in the performance of their official duties. The Advanced Degree Program in Integrated Water Resources Planning and Management has been developed to ensure that the USACE maintains its standing as a leader in water resources planning and management. The program was designed to promote interdepartmental degrees at the graduate level that were specifically geared towards water resources practitioners.

IWR has worked closely with the Universities Council on Water Resources (UCOWR) to develop a program which addresses the many challenges that the water resources planning and management community faces.

Courses are offered at five universities: The University of Arizona; The University of Florida; Harvard University; Johns Hopkins University; and Southern Illinois University.

Since the program's initiation in 2002, 36 employees have enrolled in the program. To date, 14 students have graduated from the program, two in 2005, five in 2006, and 7 in 2007.

More than 50% of the students, either currently enrolled in the program or who have completed the program, have taken their entire program via distance learning. In particular, the University of Florida has been at the forefront of developing distance learning opportunities for participants in the program.

REIMBURSABLE TECHNICAL ASSISTANCE

Reimbursable project work was undertaken for USACE field offices as well as: HQUSACE Civil Works Planning, Engineering, Operations-Regulatory and Office of Homeland Security; the HQUSACE Office of Interagency and International Activities; the Corps Engineering Research and Development Center (ERDC) - Coastal and Hydraulics and Environmental Labs; the Federal Emergency Management Agency; the International Joint Commission (IJC); the U.S. Agency for International Development (USAID); the National Weather Service; the U.S. Geological Survey; the Natural Resources Conservation Service; other Federal agencies; and approved Thomas Amendment Agreement technical support to the Lower Colorado River Authority, Texas and the Tampa Bay Water Authority, Florida. Other projects for IWR's USACE clients included navigation systems economic evaluation, technical advice and guidance on plan formulation, incremental cost and cost effectiveness analysis, risk analysis, watershed and reservoir system modeling, water quality, river hydraulics, wetlands hydrology, water control management, regional statistical analysis, flood damage analysis, flood warning response systems, GIS applications in hydrology and hydraulics, groundwater modeling and water supply in support of interagency investigations.

IWR worked on a variety of projects including: post-Katrina IPET support, hydraulic modeling, and risk analysis; Ft. Worth Flood Warning modeling; development of an integrated forecasting model for the National Weather Service for joint operations on Feather and Yuba Rivers, CA; Tooele and Ft. Huachuca groundwater modeling; development of HEC-RPT software for use on the Savannah River as part of the Sustainable Rivers Project; providing additional features in RAS software for the Tampa Bay Water Authority; helping the Lower Colorado River Authority implement CWMS for their water management needs; contributing to the revision of Bulletin 17B; writing levee certification guidance; working with the Corps Screening Portfolio Risk Assessment teams evaluating the safety of our Nation's dams; and numerous miscellaneous consultations.

IWR staff provided reimbursable technical assistance to the Louisiana Coastal Protection and Restoration (LACPR) study team that is investigating long-term risk reduction strategies for southern Louisiana. An IWR senior economist and senior social scientist are integrated into the team and have assisted the development and execution of the risk-informed planning strategy. IWR has the lead for planning non-

structural measures, including the formulation and evaluation of alternatives as well as development of the implementation strategy for these measures within the comprehensive plans.

Internationally, IWR conducted work in Iraq and Afghanistan. USAID funded both of the Middle East efforts. In Iraq, IWR/HEC worked with the Iraq Ministry of Water Resources on the Strategy for Water and Land Resources in Iraq project. This effort extended the Iraq water management tool for the Tigris-Euphrates River basins, which included the reconstruction of historical data and completion of the HEC-ResSim model. HEC also collaborated with the U.S. Geological Survey to begin the renovation of Iraq's stream gage network. In Afghanistan, HEC developed an operations manual and performing a water budget analysis for the Kajakai Reservoir in the Helmand Valley of Afghanistan. Both the Iraq and Afghanistan work included training of our international partners.

CIVIL WORKS PROGRAM AND PROJECT INFORMATION

IWR maintains, develops and provides a full range of international, national and USACE project and program data and information for decision support for the Corps, other federal government agencies, the private sector, and the public on key Civil Works activities. National water resources database concept development, design, implementation, operation and maintenance activities are provided through a combination of in-house and private sector systems analysts, statisticians, engineers and scientists who work in close coordination with USACE users. Also IWR acquires external data from other federal agencies and private sector sources, to be used by the Corps for integrated analysis and benchmarking. These data are used within the Corps for program management, budget development and justification, OMB Program Assessment Rating Tool, numerical models and real time management at the project. Major initiatives within the past year have been the development and creation of performance measurer for the Corps business lines to reflect the efficiency and effectiveness of the programs and analysis.

Navigation Data Center: The Navigation Data Center (NDC), located at the National Capital Region headquarters of IWR at Ft. Belvoir, VA., is the central manager of navigation, hydropower, recreation, environmental stewardship, water supply and regulatory program data for the Nation. Information provided by NDC directly supports the USACE annual

Civil Works performance-based budgeting program. NDC is responsible for national level executive oversight and management responsibilities, including the development of Federal and USACE Engineer Regulations (ER's), the Code of Federal Regulations, and their enforcement. OMB, acting on legislative mandates, recognizes USACE, acting through NDC, as the Federal collection agent for waterborne commerce, vessel activities and waterway infrastructure data and statistics.

NDC accomplishes its objectives of supplying timely and accurate data through the following activities: assessing user requirements; developing, designing, operating and maintaining systems to collect, process and store data and information; developing and disseminating data, information and statistical products; training providers and users of project and program information and data; and maintaining knowledge of the latest developments in the area of technical and content interoperability.

As a national statistical center, NDC coordinates extensively with other Federal statistical agencies and data users, representing the U.S. government before other nations in the development of data and information standards and protocols and in the negotiation of data exchanges. NDC actively participates in corporate information integration and coordination within the USACE and plays a lead role in developing, coordinating and disseminating water resources information for performance measurement and management purposes. It leads the development of strategic communication with both internal communities of practice and external water resources interests, stakeholders and communities. Key information and data provided in FY07 include:

Waterborne Commerce and Vessel Statistics: Under the authority of the River & Harbors Act of 1922, as amended and codified in 33 U.S.C. 555, the USACE is to collect, process, distribute and archive waterborne commercial vessel trip and cargo data. These data and statistics are used to analyze the feasibility of new water transportation projects and activities; to set priorities for new investment and rehabilitation; and for management of the operation and maintenance of existing projects.

Under Federal law, vessel-operating companies must report domestic waterborne commercial vessel movements directly to the USACE. The types of vessels include: dry cargo ships and tankers, barges (loaded and empty), towboats (with or without barges in tow), tugboats, crew boats and supply boats to offshore locations and newly constructed vessels from

shipyards to the point of delivery. Vessels remaining idle during the monthly reporting period are also reported. U.S. foreign waterborne import, export and in-transit cargo and vessel movement data is provided to the Corps by the U.S. Customs and Border Protection, the U.S. Bureau of the Census and the Port Import Export Reporting Service.

Movement data acquired by the NDC Waterborne Commerce Statistics Center is primarily for the use of the USACE and other governmental agencies. Since 2004, data have been incorporated into the USACE budget preparation process, providing the navigation project outputs and performance measures used to rank and justify operation and maintenance funding requests. Summary statistics, which do not disclose movements of individual companies, are also released to private companies and to the general public.

International Trade Data System (ITDS)

During FY07, the Institute's Navigation Data Center continued its involvement in the development of the International Trade Data System (ITDS). ITDS is a multi-agency technology initiative administrated by the e-Customs Partnership (eCP), a public-private partnership led by Customs and Border Protection (CBP). Both the public and private sectors have steering committees and numerous sub-committees.

The objective of this initiative is to provide a secure, single source interface for the collection, input, analysis, and proper dissemination of international trade and transportation statistics. The Corps is one of over 20 government agencies working with the trade and transportation community to implement this initiative.

In FY07, the USACE signed a Memorandum of Agreement (MOA) to receive trade data from the Customs and Border Protection and the Census Bureau; completed a Concept of Operations for interfacing with CBP systems through ITDS, and harmonized the Corps data elements with those of 40 other government agencies participating in ITDS and mapped data definitions to the World Customs Organization Standard Data Set.

Coastal and River Information Services (CRIS)

CRIS is a public-private initiative lead by the USACE, the U.S. Coast Guard, NOAA, the IRS, and private sector representatives to establish a single method for electronic reporting and disseminating information on U.S. coastal and inland waterways. CRIS members serve on several Integrated Action

INSTITUTE FOR WATER RESOURCES

Teams on the Committee for the Marine Transportation System (CMTS).

The goal of this effort is to provide a framework by which domestic transportation and related information on U.S. coastal and inland waterways can be transmitted and received using one message, one set of codes, and at one time for Federal reporting purposes. The program will serve a wide range of safety, operational, security, environmental, and statistical needs.

In FY 07, the agencies involved with establishing the CRIS system created a permanent working group comprised of representatives from the USACE, the Coast Guard, the IRS, and private sector to focus on addressing the need for standardized coding schemes for vessels, commodities, and locations; migrated two legacy dock inventory systems into one modern system (Master Docks Plus); established a partnership with the University of Toledo to streamline the process for obtaining information on navigation points of interest; and completed a proof of concept for demonstrating the capture of data at lock in New Orleans using an automated information system.

Navigation Infrastructure Inventory: Navigation Infrastructure Inventory information supports the USACE Federal Central Collection Agency responsibility for documenting the Nation's commercial port infrastructure served by Federal channels. Data for over 9,280 individual docks is available in published reports and on the Internet in summary form and as data files. Data are updated and posted as each port area is re-surveyed and verified as current.

The initiative begun in FY06 to survey the ports of Southern Louisiana (west of New Orleans and east of Lake Charles, LA) is partially completed. This includes a portion of the Gulf Intracoastal Waterway, Vermillion River including Intracoastal City, Port Fouchon, Port Iberia, West St. Mary, the Barataria Waterway, Houma and Morgan City. Surveys were completed for approximately 450 ports, leaving about another 300 ports to be surveyed.

Navigation Infrastructure Inventory information is used to identify industries served by the Federal channels and is part of the budgetary process of prioritizing projects. The U.S. Coast Guard is another primary user of the information in the execution of its homeland security mission. Another new initiative begun in FY06 was the establishment of a central database of all USACE navigation projects

(Navigation Project Profile) with the critical attributes required for the budget prioritization process. The information uses OMBIL to more fully describe all aspects of a project.

Lock Performance and Characteristics: The lock performance database provides the USACE access to individual lock near-real-time information as well as summary and performance statistics. The data are entered into the database by the lock operator as the vessel is locking through the chamber. A national data warehouse provides all USACE users direct access to current and historical data and summaries. The data is used by the USACE and other agencies, such as the U.S. Coast Guard and the Tennessee Valley Authority (TVA), in the execution of their missions and in the formulation of the USACE budget. A successful pilot project at several New Orleans lock sites demonstrated the ease of using the Coast Guard required vessel Automated Information System (AIS) signal to increase lock operator situational awareness by visualizing on a map the location and identification information of all vessels in the vicinity of the lock. This enables the operator to better plan the locking procedure. The capture of the AIS signal also will allow selected timing events to be automatically entered into the database.

Lock characteristics data and the physical descriptions of all the USACE owned and operated locks are updated as information changes. Lock characteristics and performance data and information are available on the public web site, <http://www.ndc.iwr.usace.army.mil>. The lock databases are feeder systems to the OMBIL decision support system.

Dredging Statistics: This web-based ORACLE database is successful in supplying information on all USACE performed and contracted dredging to the USACE, industry and private users. Data entry and report generation is accomplished via the USACE intranet and enables all USACE members to access the central system information. Data is used to generate the Small Business Report for dredging contracts. Biweekly reports are posted on the public web site to inform the industry and public of Corps and contracted dredging activities. Standard reports and summaries plus custom queries and reports are quickly generated to meet Corps and user needs. Use of the information has resulted in improved bidding competition and more efficient utilization of dredging equipment. The dredging database is a feeder system to the OMBIL decision support system.

Recreation: Recreation data for the Corps' 4300 recreation areas are collected and maintained within the OMBIL database. Recreation inventory (recreation areas, visitor centers, facilities, and amenities), outputs (e.g. visitors, visitor hours) and activities (e.g. citations and interpretive contacts) are combined with revenues and expenditures to produce performance measures that assist the Corps in making management decisions for the Recreation program. These recreation data are furnished to public websites such as Value to the Nation, www.vtn.iwr.usace.army.mil, CorpsLakes, www.CorpsLakes.us, and the federal recreation website, www.recreation.gov. In FY07, OMBIL has focused on data quality control and generation of a complete inventory of recreation projects. OMBIL also supported the budget process by continuing to supply data to the RECreation Budget Evaluation SysTem (Rec-BEST) and the new RecStatus, project information and benchmarking report, both developed by ERDC.

IWR, in collaboration with ERDC, has provided additional technical support to Corps Recreation Business line activities. The activities that were accomplished in FY07 include: continuing to support the Performance Based Budget Development for Recreation Business line; Regional Economic Impact Analysis of Recreation; GIS Application and the implementation of Google Earth application for all Corps Recreation projects; and other miscellaneous technical support to Corps Natural Resources management activities.

IWR worked with Headquarters on a new engineering regulation concerning survey guidance. IWR redesigned and enhanced the guidance provided on the website for conducting recreation surveys of the public. IWR also provided technical support for individual survey submissions and updated the website with the revised compendium of OMB-approved surveys.

Hydropower: Hydropower data from the 75 Corps power plants is collected and maintained within the OMBIL database. For those power plants in the Northwestern Division that have automated control systems (Generic Data Acquisition and Control System or "GDACS"), electronic upload of generation data is in place. Data such as power generation statistics, unit availability and revenue generated, enable the Corps hydropower program to determine its performance, make budgeting decisions and furnish OMB with program performance information. In FY07, all five hydropower

performance measures for the FY09 budget process were supplied by OMBIL hydropower data.

Water Supply: IWR serves as the HQUSACE national program manager for the Water Supply business program. In this capacity, the yearly budget and the five-year development plan for that portion of the USACE Water Supply budget is developed in coordination with the MSCs and the strategic plan as presented in the Program Assessment Rating Tool. It is necessary to develop yearly budget guidance to the MSCs, collect their data, prioritize it in conjunction with the seven other business lines and eight program areas, present the data to the senior leaders of Civil Works, the Assistant Secretary of the Army (Civil Works) and a panel of water supply examiners from OMB. The yearly program must then be modified and adjusted as necessary based on OMB comments and directives.

IWR is responsible for the development and maintenance of the USACE database of Water Supply projects. This database was originally developed in 1996, updated in 2004 and again in 2005. In 2006 an effort was undertaken to develop a Water Supply module in OMBIL and this effort is still underway. This process, once loaded into the Water Supply module of OMBIL, will enable a continual update of the OMBIL data, similar to other business lines. There was no 2006 database due to the effort required to load OMBIL. For the 2007 database we are using a combination of the new OMBIL data, where loaded and the old 2005 data from those districts which have not completed the loading process. The 2007 database shows there are 134 Corps multipurpose projects which contain storage space for municipal and industrial water supply. These projects are located in 26 states, Puerto Rico and in 24 of the 38 Corps districts. In these projects the Corps has 316 repayment agreements representing some 9.38 million acre-feet of storage space and an investment cost of \$1.28 billion. The storage space is capable of providing some 5 billion gallons of water per day for use by municipalities and industries which have signed repayment agreements. All monies collected by the repayment agreements are deposited into the Treasury of the United States.

Optimization Tools for Navigation (OTN): The optimization tools for navigation program supports multiple initiatives concerning methods and analysis to minimize costs or enhance efficiencies for asset management of the Corps' waterborne navigation operation and maintenance (O&M) program. Related initiatives include support for development of CADET (in partnership with ERDC as technical scoping and

review lead and NAVSEA-Carderock as prime technical developer), development of a centralized system for benefit evaluation of the O&M program for deep-draft harbors (NNOMPEAS), research and investigation to better quantify critical inputs for navigation analysis conducted with assistance of the U.S. Naval Academy, and support to the USACE Marine Design Center (USACE-MDC).

INTERNATIONAL WATER RESOURCES

The Institute formed the International Water Resources program in 2006 as a means to better coordinate the various international initiatives that are under its purview. These initiatives fall into three categories: global water resources strategies, international partnerships, and technical and advisory support. These initiatives and the major projects that fall under them are:

Lake Ontario and St. Lawrence River Study: The international Lake Ontario-St. Lawrence River Study was conducted and completed by IWR for the International Joint Commission (IJC). A [final report](#) was submitted to the Commission, recommending three alternative plans for their consideration. The purpose of the study was to assess and evaluate the Commission's *Order of Approval*, developed in the late 1950's and used to regulate outflows from Lake Ontario through the St. Lawrence River. During the course of the 50 years of operation, there were many changes in the operating plans, changes of flow regime, ecology and other new uses, such as recreational boating. This five-year, \$20 million study developed numerous options and recommended three candidate plans after evaluating the impacts of changing water levels on shoreline communities, domestic and industrial water users, commercial navigation, hydropower production, the environment and recreational boating and tourism, along with forecasted effects of climate change. The study was conducted in full partnership with Canada, utilizing a transparent planning process pioneered by IWR and known as Shared Vision Planning (SVP). The open citizen and public participation process was guided by a volunteer Public Interest Advisory Group appointed by the IJC, while the study team of approximately 150 scientists and engineers was composed of a broad assembly of multi-disciplinary technical experts on nine technical working groups and led by co-directors from Canada and the U.S. The U.S. co-director was Dr. Eugene Stakhiv and U.S. co-Manager was Dr. Anthony Eberhardt of IWR.

IWR staff provided input throughout 2007 on refining the candidate plans based on agency review and consultation. It is expected that the IJC will present its selected option at public hearings and information meetings around Lake Ontario during the spring of 2008.

International Upper Great Lakes Study: As the Lake Ontario - St. Lawrence River Study ended, in May 2006 USACE/IWR signed a MOA with the International Joint Commission for initiation of a new 5-year, \$15 million study focusing on the Lake Superior Regulation Plan and the potential erosion problems associated with the St. Clair River channel (thought to cause the long-term lowering of Lake Michigan/Lake Huron levels). Drs. Eugene Stakhiv and Anthony Eberhardt were appointed as U.S. co-Director and co-Manager and IWR was again selected to lead the U.S. contributions to the study, emphasizing the success of the Shared Vision Planning approach in the just concluded Lake Ontario – St. Lawrence River study.

IWR plans to initiate activities related to investigating whether the current Lake Superior outflow management procedures could be improved, considering evolving Upper Great Lakes interests and climate change, and investigating St. Clair River flow characteristics, determining how the natural regime of the river has been changed by human activities. Further on-going changes may affect the water level relationship between Lakes Michigan, Huron and Erie. Activities which have taken place since this study was officially initiated in March 2007 include:

- Bathymetric/topographic data collection at selected sites throughout the St. Clair River.
- Workshop of invited hydroclimatic experts to discuss the likelihood on the declining upper Great Lakes being due to short-term variability or the beginnings of long-term climate change.
- Establishment of two task teams: Lake Huron Outflow/St. Clair River Conveyance Task Team to investigate through hydrologic, hydraulic and sediment transport modeling the factors that may be responsible for declining levels and the Lake Superior Regulation Task Team to investigate improved outflow management plans. Dr. Eberhardt is U.S. co-lead of the Lake Superior Task Team.
- Wide-agency and academia support for assigning members and leads to the ten technical work groups investigating particular study aspects. Several members and leads are

from Corps offices, ERDC, HEC and CRREL.

- Cooperative investigations between IWR and USGS and NOAA, and universities around the Great Lakes.
- Development and implementation of a communications plan.
- Assistance by IWR staff with the IJC in the development of procedures to perform independent peer review throughout the Study.

World Water Council: The World Water Council (WWC) is an international association of over 400 private and public organizations involved in water-related activities. Formed in 1996, the WWC includes the principal United Nations water agencies and international banks as its founder organizations. The main activity of WWC is hosting the World Water Forum, which is held once every three years. As the main international event on water, it seeks to enable multi-stakeholder participation and dialogue to influence water policy making on a global scale, thus assuring better living standards for people all over the world and a more responsible social behavior towards water issues in line with the pursuit of sustainable development. The 4th World Water Forum (WWF) was held in Mexico City in March 2006 with the theme "Local Actions for a Global Challenge". The technical program included the previous Chief of Engineers, LTG Carl Strock, as a keynote speaker. Several USACE representatives participated in that event.

In 2006, Mr. Steven Stockton, Director for Civil Works, was elected as a WWC governor and an alternate on the Board of Governors. Dr. Jerome Delli Priscoli of IWR serves as the alternate and is a representative on the Executive Committee. Ongoing WWC activities involve close liaison with the U.S. Department of State on the dialogues and content of WWF, particularly the Bureau of Near Eastern Affairs and the Bureau of Oceans and International Environmental and Scientific Affairs, to assist U.S. interests. During this period, Dr. Delli Priscoli continued to serve as Editor-in-Chief for *Water Policy*, which is a peer-reviewed international journal that is published six times per year.

Fifth World Water Forum: IWR provides technical leadership for the Corps and the U.S. Government's participation in the Fifth World Water Forum (WWF5) scheduled for 15 - 22 March 2009 in Istanbul, Turkey. The forum is an international event sponsored by the World Water Council. An IWR

employee is stationed in Istanbul, Turkey, to represent the US Government in the various deliberations and activities leading to the Forum. The theme of the Forum is "Bridging Divides for Water" to include not only geographical barriers but conceptual barriers among water cultures, rich and poor and developed and developing regions. The objectives of the World Water Forum are to increase understanding and improved information exchange among water users, decision makers, experts and practitioners at all levels.

These activities and subsequent efforts by IWR will contribute to the success of WWF5, strengthen and expand interagency and international partnerships, and help to achieve U.S. government goals for international water resources.

Sixth Inter-American Dialogue on Water Management: In preparation for the Fifth World Water Forum, IWR participated in the Sixth Inter-American Dialogue on Water Management held in Guatemala City, Guatemala, August 12-17, 2007. The Dialogue was sponsored by the Government of Guatemala and the Inter-American Water Resources Network in collaboration with the Organization of American States, UNESCO, the Inter-American Development Bank, and other private and non-profit organizations. One of the main objectives of the Dialogue was to produce input for the World Water Forum on behalf of the Southern Hemisphere.

IWR Director, Mr. Robert Pietrowsky, represented USACE at the conference, and delivered a keynote presentation and spoke on several panels, while IWR specialists facilitated numerous sessions on integrated water resources management, water alliances, governance and empowerment, national water plans and collaboration in water management. Plans for collaborating on a variety of capacity building and technical assistance initiatives with Chile under the terms of the partnership agreement between IWR and the UNESCO Category II Water Center for Arid and Semi-Arid Zones of Latin America and the Caribbean (CAZALAC) were also discussed, along with cooperation with Brazil, and UNESCO-IHP during the Dialogue.

UNESCO Partnerships: A large number of UNESCO-related activities are sanctioned by the U.S. Government; in particular those related to the U.S. National UNESCO Commission and the U.S. International Hydrological Programme (IHP) Committee. In 2006, the IWR Director was selected to

INSTITUTE FOR WATER RESOURCES

be one of six permanent Federal agency members of the newly established U.S. National IHP Committee.

In support of these activities, USACE has five MOUs with IHP and its UNESCO water centers: an umbrella agreement with IHP; a second MOU with UNESCO-IHE (Institute for Water Education, Delft, the Netherlands); and newer IWR agreements with ICHARM (International Center for Hazard and Risk Management) in Tsukuba, Japan (signed July 3, 2006); CAZALAC (Centre for Arid and Semi-arid Zones of Latin America and the Caribbean) in Chile (signed July 3, 2006); and CATHALAC (Water Center for Humid Tropics of Latin America and the Caribbean) in Panama (signed August 22, 2007). IWR manages these agreements and is also engaged through an MOU with the Global Water Partnership (GWP) and its efforts to implement integrated water resources management in developing countries. GWP is an international NGO with the financial support of the European Union and the World Bank. IWR has been working with select members of the GWP Technical Working groups to develop protocols for IWRM.

During 2007, the key activity was the preparation of a proposal for establishing the “International Center for Integrated Water Resources Management (ICIWaRM)” to the US National UNESCO Commission. The proposal was submitted in December, and underwent a national-level competition. ICIWaRM was selected as the US nominee for consideration by UNESCO as a Category II Center.

Two IWR NRC Fellows were selected to work on UNESCO-CAZALAC joint projects, which included plans for a training workshop on applying “L-moments” for a ‘Drought Atlas for South America.

IWR Director, Mr. Robert Pietrowsky, was formally appointed to the UNESCO-IHE Board, and attended the 50th Anniversary of the UNESCO-IHE in Delft, the Netherlands as a sitting member of the Board in June, 2007.

Dr. Eugene Stakhiv was elected chairman of the ICHARM Advisory Board, and began working with ICHARM to prepare for the ‘International Flood Defense Conference’, to be held in Toronto in May, 2008.

FY07 saw the continued training of an additional 11 in-residence Master’s and Doctoral Degree water specialists from the Iraqi Ministries of Water Resources, Agriculture and Public Works at the

UNESCO-IHE, Delft, the Netherlands, funded by USACE, through IWR.

Additional activities in 2007 included the following: IWR led the development of the Draft Strategic Plan for the U.S. National IHP Committee, which was adopted at its spring semi-annual meeting in April, 2007, and confirmed by the full U.S. Commission for UNESCO at its annual meeting in May. Dr. Stakhiv was invited to a GWP Regional meeting in Ukraine in March, 2007, as part of the MOU, to participate in a workshop on IWRM. As part of the MOU establishing the ICIWaRM, Dr. Stakhiv participated as invited speaker to conferences at the University of Arizona in October, 2007 and the Stockholm Water Conference in August, 2007 on a Global Water Partnership panel. Mr. Pietrowsky and Dr. Stakhiv attended the fall U.S. IHP Committee meeting in November 2007 to help finalize the call for proposals and evaluation criteria for determining the U.S. nominee for a Category II Center. Dr. Stakhiv represented ICIWaRM as an invited expert on climate change and water resources at a World Water Council workshop in Delft in December, 2007. Preparatory activities for an “International Conference on Floodplain Ecohydrology” were initiated, and Dr. Stakhiv was named as Conference co-chair.

Activities in support of the UNESCO Hydrology, Environment, Life and Policy (HELP) program were initiated jointly with the National Science Foundation’s Science and Technology Center for Sustainability of Semi-Arid Hydrology and Riparian Areas (SAHARA) at the University of Arizona.

In 2008 the USACE and IWR will take a more active role in international water-related research and policy issues through the ICIWaRM Center. UNESCO, IHP and GWP serve to develop and implement innovative ideas, tools and policies related to improved water management. Active involvement in these forums enhances the stature of the USACE and works as a two-way technology transfer mechanism. IWR’s involvement in these forums has substantially elevated the USACE international profile. A key new activity is engagement in and support to the IHP World Water Assessment Program in preparation for the World Water Forum in Istanbul, Turkey in March, 2009. IWR/ICIWaRM expects to engage a number of visiting scholars and NRC Fellows to assist in the extensive effort, as well as the International Navigation Association (PIANC). The International Flood Defense Conference and the Floodplain Ecohydrology Conference will take place in May, 2008.

Dutch Rijkswaterstaat: The Corps signed an MOA with the Dutch Rijkswaterstaat (RWS) in May 2004 as a means to more effectively exchange information and resources. The RWS has a mission quite similar to that of the USACE and much collaboration has transpired regarding flood and coastal management and protection measures and policies in the aftermath of Hurricanes Katrina and Rita.

The second and third of a series of technical workshops was conducted respectively in The Hague and New Orleans. Representatives from ERDC, HQUSACE, USACE Districts, the State of Louisiana and IWR continued to exchange views on a broad range of topics, including risk-informed decision making, advanced dredging technologies, soft soil improvement, non-structural floodplain management and design-build contracting. A senior-level Dutch delegation re-visited Washington, DC to discuss the MOA with Corps Headquarters representatives and ASA-CW. The delegation then visited sites within the Sacramento District and participated in a round-table discussion on the regional levee system. The Netherlands Water Partnership conducted an independent assessment of coastal Louisiana under the auspices of the MOA. That study, which was performed by a large number of Dutch experts, will be included as an annex to the LACPR report. A historical study was also commissioned during this reporting period, which should be available for publication in early 2009.

Workshops between the two organizations on matters related to floodplain and coastal zone management will continue in FY08. Plans are underway to devise a more strategic approach to the agreement to allow for broader USACE engagement beyond the coastal Louisiana focus. Another high-level delegation plans to visit the US in spring 2008 to assess progress in Louisiana and be briefed on the Everglades Restoration work, and a USG delegation will visit the Netherlands in April 2008 to discuss a Corps/Florida State/Netherlands agreement, which will build on the activities of the MOA. The newly-formed Dutch institute Deltares is also in consultation with the OASA(CW) and USACE to possibly partner on a complementary portfolio of research. The Dutch have developed unique approaches to a broad range of relevant topic areas, such as levee and sea wall integrity, operations and maintenance, soft soil technology, dredging techniques and risk assessment methodologies. The joint activities flowing from the MOA continued to gain momentum during this reporting period.

Japanese Ministry of Land, Infrastructure, Transport: USACE participates in an ongoing technical exchange program with the River Bureau of the Japanese Ministry of Land, Infrastructure, Transport and Tourism (MLITT). The program is governed by an Implementing Arrangement (IA) under the "Agreement between the Government of the United States of America and the Government of Japan on Cooperation in Research and Development in Science and Technology," signed in Toronto on June 20, 1988, as amended and extended. The IA was signed by the USACE Chief of Engineers at the Third World Water Forum in Kyoto, Japan, in March 2003. It names the Chief of Hydrology and Hydraulics at the St. Louis District as the Technical Program Officer, responsible for the technical exchange on the USACE side and names the Director of Civil Works as the oversight authority for the exchange. The national project management oversight authority has been delegated to IWR and within the Institute to HEC. To date, the exchange has consisted of annual technical exchange meetings alternating between sites in the U.S. and Japan and some facilitation of requests for information between USACE and the River Bureau.

In February 2008, a U.S. delegation including two representatives from HEC traveled to Tokyo, Japan as part of a Water Resources Technical Exchange meeting between USACE and MLIT. A key part of the visit was the signing of a 5-year extension of the USACE-MLIT partnering agreement, which was scheduled to expire in March 2008.

The Office of the Secretary of Defense approved the extension to the agreement on 20 February 2008 and Mr. Lloyd Pike, Chief of the HQUSACE Pacific Ocean Division Regional Integration Team led the U.S. delegation on behalf of Mr. Woodley. IWR was represented in the delegation by HEC Director Christopher Dunn and HEC Water Management Systems Division Chief Tom Evans, who is the Corps team leader for the execution of the USACE-MLIT partnership. Corps MSC and district representatives included Jim Barton, Chief of the Columbia Basin Water Management Division, Northwestern Division; Stuart Townsley, Chief of the Water Management Section, Sacramento District; Mary Roth, USACE Representative to the Missouri River Recovery Implementation Committee, Northwestern Division; and Kyle Keer, Hydraulic Engineer in the Water Management Section, Sacramento District.

The Corps also recently hosted Makoto Kutsukake, a deputy director of the Water Administration Division in MLITT's River Bureau, on a 5-month residency technical exchange with HQUSACE and IWR. Mr.

Kutsukake was awarded a grant by the government of Japan to study abroad and elected to visit USACE, FEMA, and others to focus on "New measures to prevent flood disasters, based on the appropriate mutual relation among construction of levees and dams, flood insurance and land use restriction in flood-prone area - Taking Hurricane Katrina into consideration." While in the U.S., Mr. Kutsukake also visited HEC in California and gave a presentation on Japanese River Administration and Flood Management to the Intergovernmental Flood Risk Management Committee, comprised of the leadership from FEMA, USACE, the Association of State Floodplain Managers, and the National Association of Flood and Stormwater Management Agencies.

International Technical Reimbursable Projects: FY07 continued to yield major growth in technical assistance projects undertaken in cooperation with USACE, Federal and non-Federal organizations. This collaboration included work in Iraq and Afghanistan for USAID, its contractors and local government agencies.

In Iraq, the Hydrologic Engineering Center (HEC) entered into an MOA with the U.S. Embassy Baghdad to perform training to the Iraqi Ministry of Water Resources on the application of the Tigris-Euphrates Water Management Systems Model (WMSM). Under previous contracts with the U.S. Agency for International Development (USAID), HEC developed and delivered the WMSM and documentation to the U.S. Embassy and the Iraqi Ministry of Water Resources. The WMSM is a sophisticated model that needed further explanation and training if the Iraqi Ministry is going to use it for future planning purposes. Thus, HEC has entered into an MOA to provide additional training that is to take place in FY 2008 in Amman, Jordan.

Earlier efforts on the part of HEC included partnering with USAID and the Iraq Ministry of Water Resources to assist them with the development of a Water Resources Strategy Plan for Iraq. In Phase I of this effort, HEC compiled and reconstructed the water resources database and developed a water management model for the Ministry using the HEC-ResSim software. Partnering with the USGS, HEC also assisted with the renovation of the Iraq stream gage program.

The Institute worked in collaboration with the USACE Gulf Region District and the Iraqi Ministry of Water Resources to facilitate U.S. Government sponsorship of Iraqi professors attending the Master's Degree

program in residence at UNESCO-IHE in Delft, Netherlands.

HEC performed similar services for the Afghanistan Ministry of Energy and Water. A water budget was created for the Helmand Valley watershed using the HEC-ResSim software. With the assistance of the Portland District office of the Corps, HEC is developing a draft operations manual for the Kajakai Reservoir on the Helmand. To complete the operations manual, HEC worked with the USACE Cold Regions Research and Environmental Laboratory (CRREL) to complete the snowmelt modeling. HEC prepared and delivered a final report entitled "Water Balance and Regulation Alternative Analysis for Kajakai Reservoir using HEC-ResSim" to the AED. The report is now available at the HEC website as [PR-63](#). It is the culmination of two years worth of modeling.

In early FY07, engineers from HEC and the Wilmington District of the Corps went to Kabul, Afghanistan to provide three weeks of hydrologic, hydraulic and reservoir modeling training to engineers from the Afghan Ministry of Energy and Water, professors from Kabul University and Kabul Polytechnic. HEC-HMS, HEC-RAS and HEC-ResSim software was used during the training.

In FY07, as part of the Combined Joint Task Force-Horn of Africa host nation agreement, HEC engineers presented specialized training in water resource engineering in Nairobi, Kenya and Addis Ababa, Ethiopia. The course agenda consisted of hydrologic, hydraulic, and ground water modeling training and utilized HEC-HMS and HEC-RAS software. In Kenya, the training was held at the Regional Center for Mapping of Resources and Development. The majority of the students attending the training in Kenya were government officials, many of whom worked for the Ministry of Water and Irrigation. In Ethiopia, the training was conducted at the University of Addis Ababa. The majority of attendees of the training class were graduate students of the University. Other attendees included government officials from various government offices.

In August 2007, HEC performed a levee evaluation and performance analysis for a levee along the Anseung River protecting Camp Humphreys in Korea. In addition to river flooding, interior drainage issues were addressed. Nonstructural measures such as flood warning and flood preparedness were recommended as well.

HEC continues to participate in the Civil Military Emergency Response Preparedness Program. In this program, GIS and hydraulic engineers from the USACE work with former Eastern Block nations to perform exercises to develop plans to prepare for emergencies such as dam failures. An interesting aspect of the work is that the watersheds often cross international boundaries.

Civil Military Emergency Preparedness (CMEP) and Emergency Management International (EMI) Programs: CMEP supports capacity development and improved theater security cooperation by developing and encouraging civilian and military cooperation, as well as multi-national force compatibility to plan for humanitarian response to all forms of disaster (natural and technological) and improved capability to manage the consequences of Weapons of Mass Destruction (WMD). Approval for the concept plan associated with this program was obtained on 6 Jun 06. CMEP provides a capability that has been specifically requested by combatant commanders that supports national military and strategic objectives and which USACE has been directed to perform in the HQDA G-35 Strategy, Plans and Policy Army Action Plan for Stability Operations, Army Campaign Plan Decision Point 105 approved 2 August 2007.

CMEP supports Office of the Secretary of Defense (OSD) Policy (P) priorities to shape the security environment and to support Stability, Security, Transition, and Reconstruction Activities and Operations consistent with DOD Directive 3000.05 in Phases 0-2 and 4, 5 and 0 (peace, pre- and post-war), while also reducing long-term foreign reliance on U.S. Army assets to respond to emergencies. CMEP activities occur in the Warsaw Initiative (formerly part of the Soviet Union) countries while EMI activities can occur anywhere else.

Program objectives are accomplished through a range of seminars, workshops, and Table Top Exercises (TTXs). These can be performed in bilateral and multilateral formats depending upon the needs of the country and the region as determined by country officers, Combatant Commands (COCOMs), and OSD (P). Specific activities focus on the following areas: how disaster response is managed by federal agencies in the United States; an introduction to emergency response in the private and public sectors (at all levels) in democracies; national GIS seminars and workshops; evaluations of disaster response capability; regional GIS seminars; how to develop national response plans; how to build national emergency operations centers; national and regional

response to all (or any specific hazard); and special topics as determined by the host nation.

Specific activities in 2007 included: Black Sea Initiative TTX in Georgia (participating nations: Georgia, Romania, Bulgaria, Moldova, Turkey, and Ukraine); initial concept meeting for the next Black Sea Initiative TTX to be hosted by Moldova; support of the South Eastern Europe (SEE) CMEP Council Technical (June) and Annual meetings (hosted by Bosnia-Herzegovina); Balkans regional GIS workshop hosted by Macedonia; GIS workshop for Uzbek Ministry of Emergency Services; disaster response capability evaluation in Kazakhstan; U.S. federal disaster response for Uzbekistan and Kazakhstan; participation in the U.S. – Russian Joint Emergency Management Committee; Consultative Staff Talks for Uzbekistan with CENTCOM; meetings with EUCOM country desk officers; host of EUCOM Warsaw Initiative Funds meeting; and visit to EMERCOM of Russia’s southwestern region to observe flood fighting.

INTERNATIONAL NAVIGATION ASSOCIATION (PIANC)

The International Navigation Association (PIANC) is an organization consisting of approximately 40 member nations. From its headquarters in Brussels, Belgium, it acts as a clearinghouse of technology and experiences relating to ocean and inland navigation improvements which are exchanged among engineers, scientists, port operators and marina and vessel owners, to name a few. Its objective is to advance, on a worldwide basis, the sustainable development of all kinds of navigation through the exchange of technical information on port and waterway development. The objective of the Association is met by holding International Congresses and by publishing technical bulletins and special reports. Special reports are published describing the results of the work of international research teams, or working groups, composed of those national members interested in the particular subject under study. The organization also serves as an excellent source of identifying individual and corporate expertise throughout the world on PIANC-related subjects.

The United States, a member of PIANC since 1902, provides an annual appropriation for the support and maintenance of the organization. This includes an annual subvention to PIANC and payment of a portion of the travel expenses of officially appointed U.S. delegates (Commissioners) to meetings of the Annual General Assembly and Congresses. Total annual

INSTITUTE FOR WATER RESOURCES

appropriation for the U.S. Section PIANC is currently \$45,000, including the annual subvention of approximately \$15,000. The U.S. Section is administered by law under the auspices of the USACE. It is located at the IWR NCR Humphreys Engineer Center facility. The U.S. Section is composed of dues-paying individual and corporate members. U.S. Section membership on September 30, 2007 totaled 236, consisting of 202 individual members and 34 corporate members.

United States National Commission: The United States National Commission constitutes the governing body of the U.S. Section. In 2007 the ex-officio officers of the U.S. National Commission were: Chairman, John P. Woodley, Jr., Assistant Secretary of the Army (Civil Works); President, MG Don T. Riley, Director of Civil Works; and Secretary, Ms. Anne Cann, an employee of IWR.

In 2007, U. S. National Commissioners were: Mr. Shiv Batra, Vice President representing the Western Region and President, INCA Engineers, Inc.; Dr. Thomas H. Wakeman, III, Vice President representing the Eastern Region and Program Manager, Regional Port Programs, Port Authority of New York and New Jersey; Dr. Robert Engler, Vice President representing the Central Region and Senior Environmental Scientist, Moffatt-Nichol; Ms. Doris J. Bautch, Director, Great Lakes Region, Maritime Administration, U.S. Department of Transportation; Mr. John Headland, Senior Vice President and Regional Manager, Moffatt and Nichol; Mr. Joseph H. Pyne, President, Kirby Corporation; Dr. Robert H. Randall, Texas A&M University, and Mr. Dave Sanford, Director of Navigation Policy and Legislation, American Association of Port Authorities.

PIANC Activities: In March of 2007, MG Don T. Riley made a presentation on how partnership works for solving complex challenges at the Coasts, Oceans, Ports, and Rivers Institute - American Society of Civil Engineer's "Ports 2007 Conference" in San Diego, CA. The U.S. Section co-sponsored the conference with COPRI/ASCE. The U.S. Section has a permanent MOU with COPRI/ASCE, as well as a specific MOU in place to partner with COPRI/ASCE on the Ports 2007 Conference.

In April of 2007, the PIANC International Annual General Assembly was held in Cochin, India. The U.S. Delegation composed of Mr. John P. Woodley, Jr., MG Don T. Riley, Mr. Bruce Lambert, Mr. Shiv Batra, Mr. John Headland, Mr. Tom Wakeman, Mr. Thorndike Saville, Dr. Robert Engler and Harry Cook.

Another major initiative for the U.S. Section was the "Smart Rivers 2007 Conference", held in September 2007 in Louisville, KY. This was the first time the U.S. Section has organized a major industry conference and the outcome was a resounding success with more than 200 navigation professionals in attendance. The theme of the conference was "Positioning Inland Navigation as a Powerful Link in the Global Supply Chain." MG Riley and Sean T. Connaughton, U.S. Maritime Administrator, were the keynote speakers. Conference participants were able to tour the on-going lock replacement project at McAlpine Locks, Jeffboat Shipyard and the Falls of the Ohio. In conjunction with the conference, the U.S. Section also organized a technical workshop entitled "The Future of the U.S. Inland Navigation System – Meeting the Challenges."

As part of the U.S. Section's Latin American outreach activities, Mr. David Grier, USACE IWR, attended the fifth meeting of the Organization of American States, Inter-American Committee on Ports (OAS-CIP), held in Brazil in September, 2007. He also attended the Executive Committee Meeting in Peru in December, 2007. The U.S. Section PIANC signed an MOU with OAS-CIP in 2005.

The U.S. Section produces a quarterly newsletter, *PIANC Bulletin*, containing U.S. Section information and industry news. Editor is Edmond J. Russo, Jr., U.S. Army Corps of Engineers, ERDC.

PIANC Executive Committee: PIANC International's Executive Committee ensures the executive management of the Association and monitors the decisions and directives of the AGA and the Council. The U.S. Rep. on the ExCom is Mr. Shiv Batra, President, INCA Engineers, Inc. (Vice President of Western Hemisphere).

Representatives to Committees and Commissions: The principal business of PIANC is the sponsorship of technical working groups. The U.S. Section is represented by Principal and Co-Principal Members of the Commissions managing technical working group activities. The U.S. representatives were:

Environmental Commission — Mr. Edmond J. Russo, Jr., U.S. Army Corps of Engineers, ERDC.

Inland Navigation Commission — Mr. John Clarkson, U.S. Army Corps of Engineers, Huntington District; Mr. William Ronald Coles, Hanson Professional Services.

Maritime Navigation Commission — Mr. E. Dan Allen, Moffatt & Nichol.

Recreational Navigation Commission — Mr. Bob Nathan, Moffatt & Nichol; Mr. Jack C. Cox, HDR.

International Cooperation Commission – Mr. John Headland, Moffatt & Nichol; Bengt Bostrom, Consultant.

Promotion Commission – Dr. Thomas Wakeman, Stevens Institute of Technology.

New Technical Working Groups: In 2007, two new Working Groups were formed. The groups are listed below along with the name of the Principal U.S. Representative.

InCom Permanent WG on River Information Services (RIS) – Mr. Richard Lockwood and Mr. Jeff Fritz
EnviCom Expert Group 3 (Climate Change and Navigation) – Dr. James Corbett

Working Group Reports Published in 2007:

There were no working group reports published in 2007.

2007 Active Working Groups and the names of the U. S. Representatives:

InCom 27 (Guidelines for Environmental Impacts of Vessels) — Dr. Thomas Keevin

InCom 28 (Developments in Automation and the Remote Control of River Works) — Ashok Kumar

InCom 29 (Innovations in Navigation Lock Design) — Dale Miller and YP Michael Tarpey

InCom 30 (Inventory of Inspection and Repair Techniques of Navigation Structures) — Robert Willis, Ron Heffron, and YP Chad Linna

InCom 31 (Organization and Management of River Ports) — Deidre McGowan and Jim McCarville

InCom 32 (Performance Indicators for Inland Waterways Transport) — William Harder

InCom Permanent RIS WG (River Information Services) – Richard Lockwood and Jeff Fritz

MarCom 39 (Monitoring of Breakwaters) — James D. Prehn

MarCom 42 (Implementation Manual for Life Cycle Management of Port Structures) — Valery M. Buslov

MarCom 43 (Minimizing Harbor Siltation) — John Headland

MarCom 46 (Maritime Freight Transshipment) - Doris Bautch

MarCom 47 (Criteria for the Selection of Breakwater Types and their Optimum Damage Risk Level) — Dr. Jeffrey A. Melby

MarCom 48 (Guidelines for Port Constructions, Related to Bowthrusters) — Marcel Hermans and Gary Greene

MarCom 49 (Horizontal and Vertical Dimensions of Fairways) — Michael J. Briggs

MarCom 50 (General Principles for the Design of Maritime Structures) — Bill Papis

MarCom 51 (Water Injection Dredging) — Timothy L. Welp

MarCom 52 (Criteria for the (Un-)Loading of Container Ships) — Dan Allen

MarCom 53 (Design and Construction of Maritime Structures in Tsunami Prone Areas) — John R. Headland and Michael J. Briggs

MarCom 54 (Use of Hydro/Meteo Information to Optimize Safe Port Access) — Robert Weeks and Majid Yavary

MarCom 55 (Safety Aspects of Berthing Operations of Oil and Gas Tankers) — Larry Cunningham, Sarah Rollings, and YP Larry Wise

MarCom 56 (Application of Geotextiles in Waterfront Protection) — Doug Gaffney

MarCom 57 (Stability of Pattern Placed Revetment Elements) — Margaret Boshek

RecCom 15 (The use of Alternative Materials in Marina Construction) — Terrence Browne

RecCom 16 (Protecting Water Quality in Marinas) — Jack Cox

RecCom 17 (Guidelines for Marina Design) — Dennis Kissman

EnviCom 11 (Management, Dredged Material Re-use and Transformation of Existing Confined Disposal Facilities) — Dr. Michael Palermo and Dr. Paul Schroeder

EnviCom 12 (Sustainable Waterways within the Context of Navigation and Flood Management) — Dr. Craig Fischenich and John Clarkson

EnviCom Expert Group 2 (Environmental Benefits of Waterborne Transport) — Keith Hofseth (chair), Alfred Cofrancesco, & Nick Pansic

EnviCom 13 (Environmental Benefits of Waterborne Transport) — Dr. Douglas Clarke and Thomas Wang

EnviCom 14 (Dredged Material Beneficial Use Options and Constraints) — Richard Gorini and Jack Word

EnviCom 15 (Environmental Aspects of Dredging and Port Construction Around Coral Reefs and Cold Water Hard Bottom Benthic Communities) — Dr. Mark Sudol and Russ Kaiser

EnviCom 16 (Management of Ports and Waterways for Fish and Shellfish Habitat) — Dr. Douglas Clarke

EnviCom Expert Group 3 (Climate Change and Navigation) — Dr. James Corbett

CoCom 2 (Best Practice for Shoreline Stabilization methods) — No U.S. Representative

IWR and U.S. Section PIANC Coordination with the Organization of American States, Inter-American Committee on Ports: IWR, through the U.S. Section-PIANC, participated in the fifth General Assembly meeting of the OAS Inter-American

INSTITUTE FOR WATER RESOURCES

Committee on Ports (“OAS-CIP”) during FY 2007 held in September in Salvador, Brazil. The CIP serves as a permanent Inter-American forum for port related issues among the 34 member states of the OAS. Its purposes include serving as the principal advisory body of the OAS on all topics concerning development in the port sector. It proposes and promotes hemispheric cooperation policies, improvements and port sector cooperation agreements, and the collection and dissemination of data and information. The U.S. delegation to the OAS-CIP is led by the Maritime Administration, USDOT, under guidance of the State Department, and with participation by EPA, the Coast Guard and the Corps through PIANC. The CIP currently has four active Technical Advisory Groups (TAGs). These include Port Operations, Port Security (chaired by the U.S.), Navigation Safety, and, the newest one, Environmental Protection. The U.S. became a new member of the TAG on Environmental Protection at the Salvador conference and is now a member of all four TAGs. The U.S. Section-PIANC is engaging the CIP to explore opportunities to share expertise on port management, development of common standards, improving dredging technology, addressing ballast water issues, and potentially assist plans for inland waterway development in the Amazon and Parana-Paraguay basins. IWR will participate in two CIP meetings in FY 2008, including the Executive Board in Lima, Peru, in December 2007 and the Third Hemispheric Conference on Port Security in Punta Cana, Dominican Republic, in April 2008.

INTERNATIONAL BOUNDARY WATERS BOARDS

In order to carry out United States obligations under international agreements, the Office of the Chief of Engineers and several Corps divisions and districts with jurisdiction over areas bordering Canada have representation on numerous international boards, committees, and other groups. The majority of these boards were established by the International Joint Commission (IJC) as empowered in accordance with the provisions of the Boundary Waters Treaty of 1909 between the United States and Great Britain (for Canada). IJC boards fall into two broad categories: boards of control, which are more or less permanent and supervise compliance over an IJC order; and engineering, technical, or study boards, which are usually dissolved after completing and reporting on an investigation assignment.

In addition to boards created by the Commission, other international boards and committees are created by treaties or other arrangement in matters concerned with the water resources of joint interest, and the members report directly to the Governments or establishing agency. International boundary waters boards and committees having Corps of Engineers memberships during the fiscal

year are listed in Table 45-1. For an explanation of the constitution of the various boards and committees, see the annual reports, Volume II for fiscal years 1977 and 1980.

In recent years the IJC has adopted an ecosystem approach for its Boards with a view toward amalgamating a number of its Boards, where it makes sense to do so, as a first step in the development of international watershed Boards. This approach stemmed from the Commission's recommendations in its 1997 report to the governments of the United States and Canada. This report was provided at the request of governments for a proposal on how the IJC might best assist them to meet the environmental challenges of the 21st century. Subsequently, governments asked the Commission, in a reference dated November 19, 1998, to further define the framework for operation of international watershed boards as recommended by the IJC in its 1997 report. The IJC provided governments with status reports in December 2000 and June 2005 on the matter and several of its boards have been amalgamated since 1998.

Comprehensive Study on Regulating Water Levels on Lake Ontario and in the St. Lawrence River

In FY2001, the International Joint Commission formed the Lake Ontario - St. Lawrence River Study Board to undertake a comprehensive five-year study to assess and evaluate the current criteria used for regulating water levels on Lake Ontario and in the St. Lawrence River. The Study Board engaged by the IJC is a bi-national group of diverse experts from government, academia, native communities, and interest groups representing the geographical, scientific and community concerns of the Lake Ontario - St. Lawrence River system. The U.S. Director of the Study is from IWR. The Corps of Engineers leads 5 of the 9 Technical Work Groups, and participates on 2 others. The Board completed its work in FY2007. The Mission of the Study was to consider, develop, evaluate and recommend updates and changes to the 1956 criteria for Lake Ontario-St. Lawrence River water levels and flow regulation, taking into account how water level fluctuations affect all interests and changing conditions in the system including climate change, all within the terms of the Boundary Waters Treaty. The Study Board completed its studies to provide the IJC with the information it needs to evaluate options for regulating levels and flows in the Lake Ontario-St. Lawrence River system in order to benefit affected interests and the system as a whole. These studies included:

- a. Reviewing the operation of the structures controlling the levels and flows of the Lake Ontario-St. Lawrence River system in the light of the impacts of those operations on affected interests, including the environment;
- b. Assessing whether changes to the Order of Approval or regulation plan are warranted to meet contemporary and emerging needs, interests and preferences for managing the system in a sustainable manner; and
- c. Evaluating any options identified to improve the operating rules and criteria governing the system.

The Study Board provided its report to the IJC on April 2, 2006, with three candidate regulation plans for the IJC's consideration. The IJC will hold a series of public meetings and work with the State Department before implementing either a new regulation plan or a new Order of Approval for Lake Ontario regulation. In FY2007 the IJC asked technical staffs of agencies to further develop two of the proposed regulation plans. An updated version of one of the candidate plans was selected by the IJC and is expected to be released for public comment in FY2008. The IJC also worked with State Department and federal agencies to revise the Orders of Approval and seek support to implement an Adaptive Management Plan.

Upper Great Lakes Plan of Study

The IJC has decided to review its Orders of Approval for Lake Superior outflow regulation and, consequently, water level impacts on affected interests from Lake Superior downstream through Lake Erie. Two recent events that might impact the study were added to the original study plan. The first issue is that of possible ongoing physical changes in the upper St. Clair River, which could impact water level changes on the upstream lake (Michigan-Huron) and downstream lakes (St. Clair and Erie). The second issue is to implement lessons learned from the Lake Ontario – St. Lawrence River Study just completed. This may provide many lessons learned to help streamline the Upper Lakes Study.

The IJC held public meetings in September 2005 to get comments on the Plan of Study. Following that, the Plan of Study was submitted to the Governments of Canada and the U.S. in October 2005. The IJC obtained funding from both Governments and named the Study Board in February 2007. The Corps Institute for Water Resources is both chairing the Study and managing its activities. Corps personnel are leading seven of the technical work groups.

REGULATORY, SUNKEN VESSEL REMOVAL AND NATIONAL EMERGENCY PREPAREDNESS ACTIVITIES

1. Regulatory Activities

Authorities. The following authorities charge the Corps of Engineers with the regulation of various construction related activities in U. S. waters and wetlands: Sections 9 and 10 of the Rivers and Harbors Act of 1899 (structures in waterways and the alteration of waterways); Section 103 of the Marine, Protection, Research, and Sanctuaries Act of 1972 (Ocean Dumping); and Section 404 of the Clean Water Act (discharge of dredged or fill material).

Work Completed. During FY 2007, the Corps reviewed and authorized more than 60,000 permit activities, 80 percent of which were approved within 60 days. Approximately 5,000 projects were issued as individual permits, and the remaining 55,000 activities were reviewed and approved under regional or nationwide general permits. General permits are issued to the public at large and define types of minor activities with no more than minimal adverse effects on the aquatic environment, which do not usually require the extensive review necessary for projects authorized by individual permits. Use of general permits provides significant relief to the regulated public by avoiding red tape for small projects with minimal environmental impacts. The Corps modified over 2500 exiting permits during FY 2007. These applications received previous authorization and, due to changes in the activity, there was a need to revise and modify the authorization. The Corps determined that no permit was required on 7400 applications. This type of determination is made when the Corps has no regulatory authority over the site and/or the proposed work. The Corps denied approximately 400 permits during FY 2007 since most projects which might otherwise have been denied a permit were either modified or conditioned to meet Corps requirements, scaled down to qualify for approval under general permits, or withdrawn. About 5,000 permit applications were either withdrawn or canceled. Under the regulatory program, the Corps made

over 56,000 jurisdiction determinations in FY 2007, many of which were made in response to requests from landowners who were not applying for permits

The Corps investigated approximately 2,000 alleged illegal activities, most of which were violations of Section 404 of the Clean Water Act. Under the permit program in FY 2007, the Corps authorized the filling of approximately 10,000 acres of wetlands but required the restoration, enhancement, or creation of more than 20,000 wetland acres, as well as utilized mitigation banks on more than 460 projects.

As required by section 314 of the National Defense Authorization Act for Fiscal Year 2004 (P.L. 108-136), the Corps, in cooperation with EPA, completed final regulations issued April 10 and effective June 9, 2008, establishing performance standards and criteria for compensatory mitigation when required by Department of the Army permits. These regulations apply equivalent standards, to the extent practicable, for compensatory mitigation done by permittees, under in-lieu fee agreements and by mitigation banks.

In June of 2006, the Supreme Court issued decisions on the cases of Carabell and Rapanos, two lawsuits regarding jurisdictional issues for wetlands and tributaries. The Corps and EPA issued interim guidance in July 2006 and final guidance in June 2007. The Corps and EPA reviewed these comments and are working to determine if a proposed rule is necessary to increase clarity and predictability for the regulatory Program.

The Corps regulatory program continued work on several critically important initiatives that will improve permit processing while increasing protections for the environment. These initiatives include proposed improvements to National Historic Properties regulations, proposed changes to the definition of fill rule, and a new consolidated Clean Water Act regulation.

Unexpended Balance - 30 Sep 07	\$ 488,107

2. National Emergency Preparedness Activities

Authority. Executive Orders 10480 and 12656 and the Federal Emergency Management Agency (FEMA) under the Robert T. Stafford Disaster Relief and Emergency Assistance Act, 42 USC 5121 et seq. are the basis of the Federal Response Plan. The cited executive directives assign significant responsibilities for such preparation (planning, training, research and testing) to the Corps. This includes responsibility for development of comprehensive national level preparedness plans and guidance for response to all regional/national emergencies, whether caused by natural phenomena or acts of man, plans for response(s) to acts of terrorism, and the local preparedness necessary to support Corps continuity of operations. The Corps provides engineering and construction support to state and local governments in response to catastrophic natural/technological disasters. Rapid response to disasters of a regional/national magnitude requires that extensive pre-emergency planning and preparedness activities be conducted to assure the availability of a work force capable of shifting from routine missions to crisis operations and the organizational command and control structure(s) necessary to provide a coordinated and comprehensive response in the critical early stages of a catastrophic disaster.

Status. During FY 2007, the Corps of Engineers continued its effort to improve the command's readiness posture and its ability to respond to various national/regional catastrophic disasters to include terrorists' attacks. Emphasis has been on those activities to prepare for catastrophic natural and technological disasters requiring major Federal support of state and local governments overwhelmed by a disaster event, and for national level emergency water planning. The primary focus during FY 2007 continued to provide support to two major national level civil planning areas: (a) support to the nation's ability to mobilize national assets to meet national/regional level emergencies and (b) support to continuity of government and continuity of operations during national emergencies. Lessons learned from past hurricanes, floods, earthquakes, and events of September 11, 2001 as well as hurricanes Katrina and Rita, indicate that improvements in response to catastrophic disasters are still required. In this regard, the Corps continues to emphasize a program that uses the deliberate planning process to develop scenario specific catastrophic disaster plans. This will result in more detailed planning and should provide for a more comprehensive response to national/regional catastrophic disasters to include terrorist attacks. More extensive coordination with Federal, state and local entities will be incorporated into plan

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

development. In this regard, following FEMA's program focus, USACE continues to play a key role in national security planning such as supporting Homeland Security strategic planning efforts, development of the National Capitol Region Response Plan and other plans as the New Madrid Earthquake, the South Florida Hurricane, the New Orleans Hurricane and other contingencies with national implications. Initial review of the Federal interagency community developed fifteen all-hazards planning scenarios (the National Planning Scenarios) for use in national, Federal, State, and local homeland security preparedness activities began. The Scenarios are planning tools and are representative of the range

of potential terrorist attacks and natural disasters and the related impacts that face our nation. Additional efforts focus on continuing to strengthen COOP readiness. Exercises, involving federal, state and local officials, contribute to a more timely and effective execution of Corps responsibilities during disasters that have national impacts. Continuing to capitalize on existing planning efforts and forums, and taking advantage of the current atmosphere of urgency regarding emergency preparedness will advance preparedness among all levels of government to improve response and ensure the health and safety of citizens, workers, and visitors in the metropolitan Washington region.

CIVIL EMERGENCY MANAGEMENT ACTIVITIES

Authority. Public Law 84-99 (33 U.S.C. 701n) (69 Stat. 186) provides the authority for the U. S. Army Corps of Engineers to provide a full spectrum of emergency management/disaster assistance activities using the Flood Control and Coastal Emergencies (FCCE) appropriation. Under PL 84-99, the Chief of Engineers, acting for the Secretary of the Army, is authorized to undertake activities including disaster preparedness for all natural disasters, Advance Measures (preventive measures when faced with an imminent threat of unusual flooding), emergency operations (Flood Response and Post Flood Response), rehabilitation of flood control works damaged by flood or coastal storm, protection or repair of federally authorized shore protective works threatened or damaged by coastal storm, and provision of emergency water due to drought or contaminated water source. Under The Robert T. Stafford Disaster Relief and Emergency Assistance Act (42 U.S.C. 5121 et seq.) (88 Stat. 143) (The Stafford Act), the Federal Emergency Management Agency (FEMA) may direct USACE to use its resources to provide assistance in the event of a major disaster or emergency declaration by the President. Under The Stafford Act and its implementing National Response Plan, USACE has a standing mission to provide assistance in the area of Public Works and Engineering, Emergency Support Function #3, for response to a major disaster or catastrophic event.

Activities. Overall, the Civil Emergency Management Program ensures timely, effective, and efficient disaster preparedness, response, recovery, and mitigation projects and services on a nationwide basis to reduce loss of life and property damage under DOD, USACE, FEMA/DHS, and other agencies' authorities. Major disaster preparedness activities included: the review and updating of disaster preparedness and response plans to ensure viability; training personnel to ensure their capability to respond to disasters; procurement and pre-positioning of critical equipment and supplies which would likely not be available during initial stages of a response; periodic exercises to test and evaluate plans, personnel and training; and the inspection of Federal and non-Federal flood control projects

to ensure their viability to provide flood protection. For each specific event, as needed, Headquarters augments its staff and the staffs of the impacted division/district(s) to manage the event, addressing areas such as resource allocations (dollars and people), funding emergency contracts, purchasing needed materials, providing technical and direct assistance, the logistics of moving people and materials, and coordinating with tribal/Federal/state/local agencies involved in the event. These augmentation activities include overtime for Headquarters, funding of field staff, emergency contracts, travel to the event area, purchasing materials and supplies, increased staffing to include providing Remote Sensing/ Geographic Information System (RS/GIS) services.

Significant Events. Work continued on the Stafford Act responses to Hurricane Katrina which made landfall twice, 25 August 2005 near For Lauderdale Florida and 29 August near Buras, Louisiana with impacts to the States of Louisiana, Mississippi, Alabama and Florida. FEMA mission assignments to USACE exceeded \$4.6 billion and at the peak more than 2,900 USACE personnel were involved in Hurricane Katrina response and recovery efforts. Hurricane Katrina mission assignments in support of FEMA for Louisiana were physically completed in September 2007.

In October 2006 Hawaii County, Hawaii experienced a magnitude 6.6 earthquake which resulted in five mission assignments totaling \$550,000 and included infrastructure assessments and dam safety assessments. Mid-October brought nearly two feet of lake effect snow to western New York and resulted in four missions totaling \$1.1M, including temporary power and oversight for the 3.2M cubic yards of debris removed. Ice Storms in January 2007 resulted in \$2M power mission for Oklahoma with 64 generators installed to critical facilities.

On 4 May a Category F5 tornado hit the City of Greensburg, Kansas physically destroying over 90% of the community. Over \$5M of missions were assigned to USACE, for landfill

REPORT OF THE SECRETARY OF THE ARMY ON CIVIL WORKS ACTIVITIES FOR FY 2007

remediation and technical assistance for temporary housing and critical public facilities. Slow moving thunderstorms caused flash flooding during June in Delaware County, NY which resulted in a \$100,000 technical assistance mission to the state. June/July rainfalls caused flooding in southeast Kansas. Eight mission assignments were made totaling over \$2M for technical assistance with temporary housing, high water marks, waster distribution and water/wastewater evaluations. A commodities team was deployed to assist FEMA logistics.

June through September 2007 experienced an unusually calm Hurricane season. Although Hurricane Dean reached Category 4 crossing the Yucatan Peninsula dissipated much of its strength prior to landfall in Mexico.

In May 2007, the Flood Control and Coastal Emergencies program received an additional emergency supplemental appropriation of \$1.5 billion to fund specific improvements relating to the consequences of Hurricanes Katrina and Rita. These project improvements include West Bank and Vicinity and Lake Ponchartrain and Vicinity, Louisiana; and hurricane storm damage reduction, flood damage reduction and ecosystem restoration within Hancock, Harrison and Jackson Counties, Mississippi.

In October 2006, fall coastal storms threatened Kivalina, Alaska school and fuel depot. \$1.2M. was allocated in October for temporary emergency repairs of the shore protection structures.

A Pineapple Express Weather System moved through Western Washington in November 2006, bringing record rainfall to the majority of the river basins along the coast. The Nooksack River Basin experienced a flood of record. In Oregon, Wilson River, Tillamook, was above historic levels. \$2.1M was allocated to flood fight and provide technical assistance across the area. Over 40 levees were identified as needing repairs with an estimated \$20M in damages

Over \$2M was allocated for flood fighting in the Missouri River Basin in May 2007, with over 1M sandbags issued, technical assistance provided to States and local sponsors, and the loan of pumps as needed. The flooding of the Missouri River resulted in over \$26M in damages to flood control projects in Iowa, Kansas, Missouri and Nebraska.

Initiated the study and preparation for the next levee raise at Devils Lake, North Dakota with an estimated cost \$5.4M.

Sutton	Ohio	Elk River	Sutton	1960	265,300	270	FARW	Concrete	220	1,921
Tygart River	Ohio	Tygart River	Grafton	1938	287,700	620	FNAR	Concrete	230	1,921

APPENDIX A
Flood Control Reservoirs Operable September 30, 2007

Name	River Basin	Stream	Community in Vicinity	Cal. Year Placed in Useful OP	Total Storage (Acre-Ft.)	Permanent Pool (Acreage) or No Pool (NPP)	Characteristics of Dam			
							Project Functions	Type	Height (Feet)	Length (Feet)
WISCONISIN Eau Galle	Chippewa	Eau Galle	Spring Valley	1969	43,600	153	FR	Earth	122	1,800

KEY FOR PROJECT FUNCTIONS:

- | | |
|---------------------------|---|
| A - Low Flow Augmentation | Q - Water Quality Control |
| D - Debris Control | R - Public Recreation (Annual Attendance exceeding 5,000) |
| F - Flood Control | S - Water Supply |
| I - Irrigation | W - Fish and Wildlife (Federal or State) |
| N - Navigation | X - Water Conservation and Sedimentation |
| P - Power | |

APPENDIX A
Flood Control Reservoirs Constructed or Contributed to by Corps of Engineers
But Operated by Others September 30, 2007

Name	River Basin	Stream	Community in Vicinity	Cal. Year Placed in Useful OP	Total Storage (Acre-Ft.)	Permanent Pool (Acreage) or No Pool (NPP)	Project Functions	Type	Height (Feet)	Length (Feet)
CALIFORNIA

APPENDIX B
Flood Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Aberdeen & Vicinity, SD (Sec 205)	1995		2007	Local Protection
Alamogordo, NM	2001		2014	Local Protection
Alenaio Stream, Hawaii, HI	1995	1997	1997	Local Protection
Alii Drive, Hawaii, HI (Sec 14)	1999	2000	2000	Shoreline Protection
Allegheny River, First Street, Ford City, PA	2001		2003	Streambank Protection
Alton to Gale Levee System, Mississippi River, IL and MO	1983		Indefinite	Local Protection
American River, Common Features, CA	2000		Undetermined	Local Protection
American River (Folsom Dam Raise), CA	2004		Undetermined	Local Protection
American River Bridge, CA	2004		2009	Local Protection
American River, Folsom Modification, CA	2000		Undetermined	Local Protection
American River, Natomas, CA	2000	1999	Undetermined	Local Protection
Aquashicola Creek (Borough of Palmerton)	1998	1999	1999	Local Protection
Antelope Creek	2001		2009	Local Protection
Arecibo River, PR	2000		2011	Local Protection
Arizona Flood Warning, AZ (Sec 205)	1998		2003	Local Protection
Atchafalaya Basin, LA	1928	(2)	TBD	Floodway and Levees
Atchafalaya Basin Floodway System, LA	1985		TBD	Water Management Units, Recreation Elements & Real Estate Acquisition
Battle Mountain, NV (Sec 205)	1998		Unscheduled	Local Protection
Beargrass Creek, KY	2002		2007	Local Protection

APPENDIX B
Flood Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Beaver Creek at Slough Hollow Road, MO (Sec 14)	1998		2000	Streambank Protection
Bethel Bank Stabilization, AK	1992	1997	1997	Emergency Bank Stabilization
Big Sioux River & Skunk Creek, Sioux Falls, SD	2000		2011	Local Protection
Big Wood River, Deer Creek, Bridge, ID (Sec 14)	1998	2001	2001	Local Protection
Blue Lick, KY (Sec 14)	2006		Indefinite	Streambank Protection
Blue River Basin, Kansas City, MO	2002		2008	Local Protection
Blue River Channel, Kansas City, MO	1984		2011	Local Protection
Bois Brule, MO	2002		Undetermined	Deficiency Correction
Brays Bayou (Houston), TX	1998		2015	Local Protection
Breckenridge, MN	2002		Indefinite	Local Protection
Brush Creek, Jeanette, PA (Sec 14)	1994		2001	Streambank Protection
Buffalo Bayou (Lynchburg), TX (Sec 205)	2002		2004	Local Protection
Buffalo Creek, Freeport, PA (Sec 14)	1994		2001	Streambank Protection
Buford Trenton Irrigation District, ND	1998		2008	Local Protection
Cache Creek Settling Basin, CA	1990	1991	2018	Local Protection
Cape Girardeau Floodwall, MO	2004		Undetermined	Deficiency Correction
Cazenovia Creek, NY	2004	2007	2007	Ice Control
Cedar Falls, IA (Sec 205)	1998	2000	2000	Local Protection
Cedar Point Seawall Extension, Bay St. Louis, MS	1998	2000	2003	Shoreline Protection
Center Hill Lake and Dam, TN	2006		20014	Dam Seepage
Center Treatment Plant, Elkhorn Run, PA	2001		2002	Streambank Protection
Chaska, MN	1988	1998	1998	Local Protection
Choctawhatchee/Pea Rivers, Alabama and Florida	1995	1997	1996	Flood Warning
Choctawhatchee/Pea Rivers, Elba Levee, AL	1999		2006	Local Protection Levees
Choctawhatchee/Pea Rivers, Geneva Levee, AL	1999		2006	Local Protection Levees

APPENDIX B
Flood Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
City of Folsom Willow & Humbug Creeks, CA (Sec 205)	1999		Unscheduled	Local Protection
City of Whittier, CA (Sec 205)	2002		2008	Local Protection
Clifton, AZ	1991	2002	2002	Local Protection
Clinton Wastewater Treatment Plant, Clinton, NC (Sec 205)	1999	2000	2005	Local Protection
Colorado River at Grand Junction, CO (Sec 205)	1994	1997	1997	Local Protection
Comite River Diversion, LA	1999		2012	Local Protection
Corte Madera Creek, CA	1966		Indefinite	Local Protection
Coyote and Berryessa Creeks, CA	1994		Unscheduled	Local Protection
Cumberland MD, and Ridgeley, WV	2003		Indefinite	Local Protection (C&O Canal)
Dade County, FL	1975		2038	Shore Protection
Dallas Floodway Extension, TX	2001		2012	Local Protection
Dane Avenue, Waveland, MS (Sec 14)	2001		2002	Shoreline Protection
Delaware River Vicinity of Port Jervis, NY	1995		1996	Local Protection (Ice Diversion)
Delta Headwaters Project , MS	1985		Indefinite	Local Protection
Des Moines Recreational River and Greenbelt, IA	1989		Indefinite	Recreation
Des Plaines, IL	1999	2012	2012	Flood Control
Dry Creek (Warm Springs) Lake & Channel, CA	1967	1983	1996	Reservoir
Dry Fork of Little Fork, Willard, KY (Sec 205)	2000	1999	2001	Local Protection
East Baton Rouge Parish, LA	2003		Undetermined	Local Protection
East St. Louis and Vicinity, IL - Rehabilitation	1988		Undetermined	Local Protection
El Paso, TX	1971	1973	2005	Local Protection
Elk Creek Lake, OR	1971		Indefinite	Reservoir
Emmonak Shoreline Erosion, AK (Sec 14)	1998	1999	1999	Shoreline Protection
Fairfield Vicinity Streams, CA	1985	1993	1993	Local Protection
Falls Lake, NC	1973	1983	2006	Reservoir

APPENDIX B
Flood Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Fallon, NV (Sec 205)	1998		Unscheduled	Local Protection
Festus and Crystal City, MO (Sec 205)	2002		2009	Urban Flood Protection
Fort Wayne and Vicinity, IN	1994	2003	2004	Local Protection
Fourche Bayou, Vicinity of Little Rock, AR	1987	1996	2007	Local Protection
Fox Point Hurricane Barrier, RI (Reimbursement)	1998	1966	2009	Major Rehabilitation
Francis Bland Floodway Ditch, AR	1986		2006	Local Protection
Galena Bank Stabilization, AK	2004		2005	Emergency Bank Stabilization
Grand Forks, ND-East Grand Forks, MN	1999		2008	Local Protection
Grand Prairie Region and Bayou Meto Basin, AR	1999		2009 ⁴	Water Supply
Great Bend, KS	1988		1994	Local Protection
Guadalupe River, CA	1992		Unscheduled	Local Protection
Guntersville Lake, Guntersville, AL	1988		1989	Streambank Protection
Gulf of Mexico, Highway 193, Mobile Co., AL	2000	2000	2002	Shoreline Protection
Gulfside Seawall, Waveland, MS	2000	2001	2002	Shoreline Protection
Halstead, KS	1991		1995	Local Protection
Hamilton County Streambank Stabilization, TN	1999		2005	Streambank Protection
Hargus Creek, Circleville, OH (Sec 205)	1996	1997	1997	Local Protection
Harmon Canal, Savannah, GA (Sec 205)	2001	2002	2002	Local Protection
Helena & Vicinity, AR	1997		2005	Local Protection
Herbert Hoover Dike, FL	2006		2025	Separate Control
Highway 52, Bellevue, IA (Sec 14)	2001	2002	2002	Streambank Protection
Holes Creek, OH	1998	2004	Indefinite	Local Protection
Hunting Bayou, TX	2003		2011	Local Protection
Jackson Hole, WY	2003		2015	Local Protection
James R. Olin Flood Control Project, VA	1994		1998	Local Protection

APPENDIX B
Flood Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Johnson Creek, Arlington, TX	2001		2009	Local Protection
Kahawainui Stream, Oahu, HI (Sec 205)	1989	1990	1990	Local Protection
Kahoma Stream, Maui, HI	1986	1990	1990	Local Protection
Kansas River, Eudora Bend , KS (Sec 14)	2002		2004	Streambank Protection
Kawainui Marsh, Oahu HI (Sec 205)	1995	1997	1997	Local Protection
Kaweah River, CA	1999		Unscheduled	Local Protection
Klamath River, Klamath Glen Levee, CA	1996		1997	Local Protection
Lackawanna River, Olyphant, PA	2002		2005	Local Protection
Lackawanna River at Scranton, PA	2001		2008	Local Protection
Lake Pontchartrain, LA	1967		Undetermined	Local Protection
Lake Wichita, Holliday Creek, TX	1987		1995	Local Protection
Larose to Golden Meadow, LA	1972		Undetermined	Local Protection
Las Cruces, NM	2000	2001	2002	Local Protection
Launiupoko, Maui, Hawaii	2002		Undetermined	Shoreline Protection
Leeper Park Island Wall, South Bend, IN (Sec 14)	1999	2004	2004	Streambank Protection
Levisa & Tug Forks of the Big Sandy River & Cumberland River, KY, WV & VA	1981		Indefinite	Local Protection
Little Calumet River, Cady Marsh Ditch, IN	2004	2008	2008	Flood Control
Little Calumet River, IN	1990	2011	2011	Local Protection
Little Dell Lake, UT	1985	1993	1996	Reservoirs
Little Puerco River, Gallup, NM (Sec 205)	2002	1993	2009	Flood Control
Little Tijuana River, San Diego County, CA (Sec 205)	2001		Indefinite	Flood Control
Long Branch Lake, MO	1973	1980	Indefinite	Reservoir
Loosahatchie, Memphis, TN (Sec 14)	1998	1998	1999	Streambank Protection
Los Angeles County Drainage Area (LACDA), CA	1995	2002	2009	Local Protection

APPENDIX B
Flood Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Loves Park, IL	1991	2004	2004	Local Protection
Lower Sacramento Area Levee Reconstruction, CA	1996		Unscheduled	Local Protection
Lower San Joaquin River, CA (Snagging and Clearing)	1985		Indefinite	Snagging and Clearing
Loyalsock Creek, Warrensville Rd., PA (Sec 14)	1999		2004	Emergency Streambank Protection
Lycoming County Flood Warning System, PA (Sec 205)	1999		2004	Local Protection
Magpie Creek & Don Julio, CA (Sec 205)	1997		Unscheduled	Local Protection
Magpie Creek, McClellan AFB, CA (Sec 205)	1997		Unscheduled	Local Protection
Marysville/Yuba City Levee Reconstruction, CA	1993	2005	Unscheduled	Local Protection
Masefau Bay, Tutuila Island, American Samoa (Sec 14)	1989	1992	1992	Shoreline Protection
Mazon River Twp Road, IL	1994	1995	1996	Streambank Protection
McCook and Thronton Reservoirs, IL	1999	2014	2023	Flood Control
Meramec River Basin (Valley Park Levee), MO	1991		2007	Local Protection
Merced County Streams, CA	1985	1994	Unscheduled	Reservoirs
Metropolitan Louisville, Pond Creek, KY	2000		2008	Local Protection
Metropolitan Region of Cincinnati Duck Creek, OH	1999		2011	Local Protection
Middle Fork Grand US 169, MO (Sec 14)	2003		2017	Streambank Protection
Middle Rio Grande Flood Protection, Bernalillo to Belen, NM	1997	1997	2009	Local Protection
Mid-Valley Area Levee Reconstruction, CA	1993		2012	Local Protection
Mill Creek, OH	1970		Indefinite	Local Protection
Minersville, OH (Sec14)	2003		2004	Streambank Protection
Mingo Creek, OK	1988		1998	Local Protection
Mississippi River Channel Improvements (IA, IL, KY, LA, MI, MO & TN)	1928		Undetermined	Channel Improvements
Mississippi River Levees	1928		Undetermined	Main Line Levees
Missouri National Rec River, NE & SD	1985		2011	Environmental Restoration

APPENDIX B
Flood Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Missouri River Levee System, IA, NE, KS and MO	1948		Unscheduled	Local Protection
Molly Ann's Brook, NJ	1995		2007	Local Protection
Mon River, Sewage Treatment Plant, Point Marion, PA	1997		2001	Streambank Protection
Mon River, Water St. Point Marion, PA	1998		2001	Streambank Protection
Monroe County, OH	2002	2002	2002	Streambank Protection
Moon Treatment Plant, Elkhorn Run, PA	2001		2002	Streambank Protection
Mt. Morris Lake, NY	1944	1952	Indefinite	Local Protection, Debris Removal & Training Wall Stabilization ⁵
Mt. St. Helens Sediment Control, WA	1986	1990	Undetermined	Local Protection
Muddy Creek Cascade, Vaughn, MT (Sec 14)	2006	1952	2006	Local Protection ⁵
Muddy Creek, Grundy Co, MO	1997	1999	2000	Streambank Protection
Mudline to Pineville, MS	1984	1985	1985	Streambank Protection
Mud Mountain Dam, WA (Dam Safety Assurance)	1986	1995	Indefinite	Modernization of Dam
Murrieta Creek, CA	2003		2012	Local Protection
Muskingum River Lakes, OH (Dam Safety Assurance)	1982		Indefinite	Modernization of Dams
Napa River, CA	1999		Undetermined	Local Protection
New Orleans to Venice, LA	1969		Undetermined	Local Protection
Nickleplate Road, French Creek, Fairfield, PA	2000		2002	Streambank Protection
Nimrod Fisheries Restoration, Nimrod Lake, AR	2000	2000	2000	Environmental Restoration
Nimrod Waterfowl Levee, Nimrod Lake, AR	1998	1999	1998	Environmental Restoration
Nogales Wash, AZ	1994	2010	Indefinite	Flood Warning System & Local Protection
Nonconnah Creek, TN & MS	1990		Indefinite ³	Local Protection
Norco Bluffs, Santa Ana River, CA	1998		2009	Local Protection
North Branch Chicago River, IL	1970	1990	Indefinite	Snagging and Clearing
North Ellenville, NY	1995		1997	Local Protection

APPENDIX B
Flood Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Oates Creek, GA	1990	1993	1992	Local Protection
Ocean City-Isle of Wight Bay, MD (Sec 14)	2001		2001	Emergency Streambank Protection
O'Hare Reservoir, IL	1990	2001	2001	Reservoir
Ohio River Flood Protection, IN	1999		Indefinite	Local Protection
Ohio River Greenway, IN	2004		Indefinite	Local Protection
Ottawa River, Shoreline Drive, OH (Sec 14)	2002		2008	Streambank Protection
Otter Brook Lake, NH	2005	2007	2007	Dam Safety Assurance
Ouachita River Levees, LA	1990		Indefinite	Local Protection
Paden City, WV (Sec 14)	2004		2005	Streambank Protection
Pajaro River, CA	1987	1989	1989	Local Protection
Partridge Brook, Westmoreland, NH (Sec. 14)	2007		2008	Emergency Streambank Protection
Passaic River Preservation of Natural Storage Areas, NJ	1997		2009	Local Protection
Perry County L & D Nos. 1, 2, 3, MO	1977	1985	1985	Local Protection
Perry Creek, IA	1991		2008	Local Protection
Petaluma River, CA	1997		Undetermined	Local Protection
Piedmont Lake, Lick Run Reclamation, OH	2001	2001	2004	Environmental Protection
Plum Borough, Allegheny Co, PA	2001		2003	Streambank Protection
Portugues and Bucana Rivers, PR	1975		2012	Local Protection
Pt. Leflore, MS	1985	1986	1986	Streambank Protection
Racitan River Basin, Greenbrook Sub-Basin, NJ	1998		2011	Local Protection
Ramapo and Mahwah Rivers, Mahwah, NJ and Suffern, NY	1990		2008	Local Protection
Ramapo at Oakland, NJ	1995		2007	Local Protection
Raritan River Basin, Greenbrook Sub-basin, NJ	1998		2011	Local Protection
Redbank & Fancher Creeks, CA	1987	1993	1994	Reservoir
Red River Basin Chloride Control (Area X) OK and TX	1991		Indefinite	Chloride Control

APPENDIX B
Flood Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Red River Below Denison Dam	1948		Indefinite	Levee & Streambank Protection
Reno Flood Warning System, NV (Sec 205)	1998	2004	2006	Local Protection
Rillito River, AZ	1994		Undetermined	Local Protection
Rio De Flag, Flagstaff, AZ	2003		2012	Local Protection
Rio Grande De Manati, PR	2001		2008	Local Protection
Rio Puerto Neuvo, PR	1994		2019	Local Protection
Rockport, IN (Sec 14)	2006		2008	Streambank Protection
Rolling Fork River, Lebanon Junction, KY (205)	2003		2007	Local Protection
Roanoke River, Upper Basin, VA	1990		2016	Local Protection
Rouge River, Southfield, MI (Sec 14)	2000	2002	2002	Streambank Protection
Roughan's Point, Revere, MA	1997	1999	2006	Local Protection
Running Slough Ditch	1990	1990	1990	Streambank Protection
Sacramento River Bank Protection, CA	1963		Indefinite	Local Protection
Sacramento River, Chico Landing to Red Bluff, CA	1963		Indefinite	Local Protection
Sacramento River Flood Control, CA	1918		Indefinite	Local Protection
Sacramento River Flood Control – GCID, CA	1998	2000	Undetermined	Bank Stabilization
Sacramento Urban Area Levee Reconstruction, CA	1990	1997	2007	Local Protection
Salinas River, San Ardo, CA	1993		1993	Streambank Protection
Salmon River, Haddam and East Haddam, CT (Sec 205)	2005	2006	2007	Ice Control Structure
San Antonio Channel Improvement, TX	1957		2002	Local Protection
Sand Cove Park, CA (Sec 14)	2005		2009	Streambank Protection
Sand Creek, NE	2007		2011	Environmental Protection
San Isidro Rd, Santa Fe, NM (Sec 14)	2000		2002	Streambank Protection
San Luis Rey River, CA	1988		2014	Local Protection
San Lorenzo River, CA	1999		Undetermined	Streambank Protection

APPENDIX B
Flood Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
San Pedro Creek, Pacifica, CA (Sec 205)	1998		2008	Local Protection
Santa Ana River Mainstem, CA	1990		2013	Local Protection
Santa Paula Creek, CA	1973		Indefinite	Local Protection
Sardis, Monroe Co, OH (Sec 14)	2000	2000	2000	Streambank Protection
Saw Mill Run, PA	1996		2003	Flood Control
Savan Gut, VI (Sec 205)	1987	1989	2001	Local Protection
Saylorville Lake, IA	1965	1977	1996	Reservoir
Schuylkill River Park, PA	1999		2007	Local Protection/Recreation
Sheyenne River, ND	1990		2007	Local Protection
Sims Bayou, TX	1990		2012	Local Protection
Skyrocket Creek, Quray, Co (Sec 14)	1998		1999	Streambank Protection
South Fork, New River, Boone, NC	2001	2002	2002	Aquatic Ecosystem Restoration
South Harrison Co, Water Corp, IN (Sec 14)	2006		Indefinite	Streambank Protection
Southeast Louisiana	1997		Undetermined	Urban Flood Control
South Sacramento County Streams, CA	2002		Unscheduled	Local Protection
Springbrook Creek, PA	1989	1990	1990	Streambank Protection
State Route A, Scotland Co., MO	2001	2002	2002	Streambank Protection
Ste. Genevieve, MO	1995	2002	Undetermined	Local Protection
St. Francis Basin	1938		2014	Tributary Levees & Channels
St. Johns Bayou- New Madrid Floodway, MO	1997		2016	Rural Urban Flood Control
Stockton Metropolitan Area, 211 Reimbursement, CA	1986	1999	Unscheduled	Local Protection
Swan Creek, Taney County, MO (Sec 14)	1984	1986	1986	Streambank Protection
Ted Rhodes Golf Course, Nashville, TN	1995	1995	1995	Local Protection
Tehama, CA (Sec 205)	1999		2007	Local Protection
Ten Mile Creek, Washington Co, Public Marina, PA	2001		2002	Streambank Protection

APPENDIX B
Flood Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Texas Flat Road, Kiln, MS	2000	2000	2001	Shoreline Protection
Thompson River, Route 6, Trenton (Sec 14)	2005		2006	Streambank Protection
Thornton Reservoir, IL	1999	2012	2012	Flood Control
Tombigbee River Tributaries, AL and MS	1965	1990	2003	Local Protection
Tonawanda Creek-Minnick Road, NY	1999		2008	Streambank Protection
Tribal Partnership Program	2004	N/A	2006	Local Protection
Tropicana and Flamingo Washes, NV	1995	2007	2011	Local Protection
Tucson Drainage Area, AZ	2003		2009	Local Protection
Tule River, CA	2002		Unscheduled	Local Protection
Tulsa and West Tulsa, OK	1943	1945	1993	Rehabilitation of Levee System
Turkey Creek, KS & MO	2003		2016	Local Protection
Turkey Creek, Sumter County, SC	1999	2001	2001	Local Protection
Turtle Creek, PA	1995		1997	Local Protection
Turtle Creek Lake, KS	2003		2015	Dam Safety Assurance
Tygart Lake, WV	1996		2001	Dam Safety Assurance
Upper Gordon Creek, Hattiesburg, MS	1993	1995	2002	Channel Improvement
Upper Guadalupe River, CA	2007		Unscheduled	Local Protection
Upper Jordan River, UT	1994		Indefinite	Local Protection
Upper Sacramento Area Levee Reconstruction, CA	1997	2005	2007	Local Protection
Upper Scioto River, Marion County, OH (Sec 205)	1986		1987	Local Protection
Upper Yazoo Projects, MS	1976		2015	Local Protection
Vicinity Willoughby Spit, Norfolk, VA	1988	Incremental	2014	Flood Control
Van Bibber Creek, CO (Sec 205)	1995		2008	Local Protection
Village Creek, AL	1989	1996	2005	Local Protection
Virginia Beach Hurricane Protection	1986	Incremental	2008	Flood Control

APPENDIX B
Flood Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Wahpeton, ND	2002		Indefinite	Local Protection
Walnut Canyon, CA (Sec 14)	1994	1995	1998	Local Protection
Walnut Creek, CA	1964	1997	1997	Local Protection
Westbank and Vicinity, New Orleans, LA	1991		2018	Local Protection
West Columbus, OH	1993		2006	Local Protection
Western Sarpy and Clear Creek, NE	2003		2011	Local Protection
West Fork, Grand River, Rte H (Sec 14)	1997		2000	Streambank Protection
West Fork, Grand River, Rte W (Sec 14)	1998		2000	Streambank Protection
West Ray, Marshall, PA (Sec 14)	1990	1990	1990	Streambank Protection
West Sacramento, CA	1996	2005	2010	Local Protection
West Tennessee Tributaries	1960		Indefinite ¹	Drainage and Flood Control
Wheeler Creek, Gainesville, TX (Sec 205)	1983	1994	1984	Local Protection
White River, Indianapolis Central, Waterfront, IN	1995		2007	Local Protection
White River, Indianapolis North, IN	2001		2010	Local Protection
White Slough, CA	1993		2008	Local Protection
Wildcat and San Pablo Creeks, CA	1980		1996	Local Protection
Williamsport, PA (Hagerman's Run)	2001		2004	Local Protection
Wills Creek, Linton Mine Road, OH	2002	2002	2004	Environmental Protection
Wolf Creek, Lake Cumberland, KY	2005		2014	Dam Seepage
Wolf River, Memphis, TN	2004		2010	Channel Stabilization
Wood River, NE	1996	2004	2007	Local Protection
WV & PA Flood Control, (Sec 581)	1999		Indefinite	Flood Damage Reduction
Wyoming Valley Levee Raising	1996		2008	Local Protection
Yonkers (Nepera Park), NY	1994		1995	Local Protection
Yuba River, CA	2003		Unscheduled	Local Protection

APPENDIX B
Flood Control Projects Under Construction
During Fiscal Year 2007

- ¹ Construction of further channel improvement was halted in 1987 due to the denial of water quality certification.
- ² Project was in useful operation before Corps started working on it. Work consists primarily of improvements to existing channels, levees, pumping stations and other flood control structures.
- ³ Environmental and Recreational separable elements unprogrammed.
- ⁴ This completion schedule is for the Grand Prairie Region separable element only.
- ⁵ O & M Funded.

APPENDIX B
Beach Erosion Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion
Assateague Island, MD	2001	2003	2028
Atlantic Coast of Maryland	1990	1994	2044
Barnegat Inlet to Little Egg Harbor, NJ	2004		Undetermined
Brevard County, FL	2000		2044
Brigantine Inlet to Great Egg Harbor Inlet (Absecon Island, NJ)	2000	Undetermined	Undetermined
Brigantine Inlet to Great Egg Harbor Inlet (Brigantine Island NJ)	2003	Undetermined	Undetermined
Broward County, FL	1965		2031
Brunswick County Beaches, Oak Island, Caswell and Holden Beaches, Portion, N.C.	2000	Undetermined	2058 ²
Brunswick County Beaches, Ocean Isle Beach Portion, NC	2000	2001	2051
Cape May Inlet to Lower Twp, NJ	1990	1991	Undetermined
Carlsbab Seawall, CA (Sec 103)	1996	1997	1997
Carolina Beach and Vicinity, NC – Area South	1995	1998	2047
Carolina Beach and Vicinity, NC – Carolina Beach Portion	1965	1982	2014
Chicago Shoreline, IL	1997	2008	2012
Dade County, FL	1975		2038
Dare County Beaches, NC (Bodie Island)	2003		Undetermined
Delaware Bay Coastline, Port Mahon, DE & NJ	2003		Undetermined
Delaware Bay Coastline, Reeds Beach to Pierces Point, DE & NJ	2003		Undetermined
Delaware Bay Coastline, Roosevelt Inlet/Lewes Beach, DE	2002	2005	2055
Delaware Coast, Bethany Beach to South Bethany Beach, DE	2004		Undetermined
Delaware Coast from Cape Henlopen to Fenwick Island, DE (Dewey/Rehoboth Beach, DE)	2000	Undetermined	Undetermined
Delaware Coast from Cape Henlopen to Fenwick Island, DE	2003	Undetermined	Undetermined

APPENDIX B
Beach Erosion Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion
(Fenwick, Island, DE)			
Delaware Coast Protection, DE	1989	1990	Undetermined
Duval County, FL	1976		2028
East Rockaway to Rockaway Inlet and Jamaica Bay, NY	1974		2010
Emeryville, Alameda, CA (Sec 103)	1993	1993	1993
Fire Island to Jones Inlet, NY	1970		2039
Fire Island to Montauk Point, NY	1963		2027
Folly Beach, SC	2005	2005	2006
Fort Pierce Beach, FL	1998		2020
Graveline Bayou East, Jackson Co., MS	2001		2002
Great Egg Harbor Inlet & Peck Beach, NJ	1991	1992	Undetermined
Indiana Shoreline, IN	1990	1995	Indefinite
Lower Cape May Meadows, NJ (Ecosystem-move)	2002		2056
Manatee County, FL	1992		2042
Martin County, FL	1994		2046
Palm Beach County, FL	1962		2048
Panama City Beaches, FL	1997		2000
Pinellas County, FL	1969		2043
Raritan Bay and Sandy Hook Bay, NJ	1973		2009
Rockaway Inlet to Norton Point (Coney Island), NY	1992	1995	2045
Sandy Hook to Barnegat Inlet, Sec I	1985	Incremental	2044
Sandy Hook to Barnegat Inlet, Sec II	1985	Incremental	2049
Sarasota County, FL	1994		2046
Shoalwater Bay, Tokeland, WA (Sec 545)	2002		Indefinite
Silver Strand Shoreline, Imperial Beach, CA	1998		Indefinite
St. Johns County, FL	1986		2046

APPENDIX B
Beach Erosion Control Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion
Surfside-Sunset and Newport Beach (Orange County), CA	2002		2010
Townsend Inlet to Cape May Inlet, NJ	2001		TBD
Tybee Island, GA	1975	1976	2024
Virginia Beach, VA (Reimbursement)	1962	1962	2012 ¹
Virginia Beach, VA	1996		2051
West Onslow Beach and New River Inlet, NC	2001	Undetermined	Undetermined
Wrightsville Beach, NC	1965	1966	Indefinite

APPENDIX B
Beach Erosion Control Projects Under Construction
During Fiscal Year 2007

¹ IAW Section 355 of WRDA 1996, the project will be extended until the earlier part of year 2012 or completion of the beach erosion control and hurricane Protection project at Virginia Beach, Virginia.

² GRR only underway. New construction start FY 2000. BCB

APPENDIX B
Environmental Restoration Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Starte d	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Albuquerque Biological Park Wetland Restoration , NM (Sec 1135)	2004		2006	Environmental Restoration
Allin's Cove, Barrington, RI (Sec 1135)	2005	2006	2008	Environmental Restoration
Amazon Creek Wetlands Restoration, OR (Sec 1135)	1999		2006	Environmental Restoration
Anacostia River & Tributaries, MD & DC	1999		Indefinite	Environmental Restoration
Arkansas River Fisheries Habitat Restoration, Pueblo, CO (Sec 206)	2002		2009	Aquatic Ecosystem Restoration
Ballona Wetland Restoration, CA (Sec 1135)	2002		2006	Environmental Restoration
Black Fox, Murfree, and Oakland Springs, TN	2001		2010	Ecosystem Restoration
Broad Top Region, PA	2004		2005	Environmental Restoration
Bull Creek Channel Ecosystem Restoration, CA (Sec 1135)	2000		2008	Ecosystem Restoration
Bull Shoals Aquatic Macrophyte Restoration, AR (Sec 206)	2003		2005	Aquatic Ecosystem Restoration
Bulls Shoals Nursery Pond, AR (Sec 1135)	2003		2006	Environmental Restoration
Central and Southern, FL	1950		Indefinite	Environmental Restoration
Central West Virginia Environmental Restoration Program	2001		Indefinite	Environmental Restoration
Chesapeake Bay Environmental Program, MD (Sec 510)	1998		Indefinite	Environmental Restoration
Chesapeake Bay Oyster Recovery, MD and VA	1997		2007	Environmental Restoration
Chicago Botanic Garden, IL	2002	2005	2005	Aquatic Ecosystem Restoration
Chief Joseph Dam Dissolved Gas Abatement, WA	2003		2009	Environmental Mitigation, Restoration and Protection
City of Santa Clarita (Perchlorate)	2002		2010	Environmental Restoration
Columbia River Fish Mitigation, OR & WA	1988		Undetermined	Environmental Restoration
Cuneo Press, Chicago River	2002		2003	Aquatic Ecosystem Restoration
Dead Lake, AL	1998		1998	Environmental Restoration
Deep Run/Tiber Hudson, MD (Sec 206)	1999		2005	Aquatic Ecosystem Restoration
Delaware Bay Coastline, Port Mahon, DE & NJ	2003		Undetermined	Environmental Restoration
Delaware Bay Coastline, Reeds Beach to Pierce Point, DE & NJ	2003		Undetermined	Environmental Restoration

APPENDIX B
Environmental Restoration Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Starte d	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Delaware Bay Coastline, Villas & Vicinity, NJ	2004		Undetermined	Environmental Restoration Aquatic Ecosystem Restoration
Dents Run, PA	1999	2003	2005	Aquatic Ecosystem Restoration
Eugene Delta Ponds, OR (Sec 206)	2000		2008	Environmental Restoration
Everglades & South Florida Ecosystem	1998		2009	Environmental Restoration
Florida Keys Water Quality Improvements, FL	2002		Undetermined	Environmental Restoration
Fort Peck Fish Hatchery, MT	2001		2006	Environmental Restoration
Gold Creek Salmon Restoration, AK (Sec 1135)	2003		2003	Aquatic Ecosystem Restoration
Greenville Marsh, IA Wetlands (Sec 1135)	2005		2006	Environmental Restoration
Gulf Intracoastal Waterway, Mad Island, TX (Sec 206)	2003		2007	Aquatic Ecosystem Restoration
Gunnerson Pond Restoration, CA (Sec 1135)	2000		2005	Environmental Restoration
Gwynns Falls, MD	2006	2006	2008	Environmental Restoration
Hamilton Airfield Wetland Restoration, CA	2001		Indefinite	Environmental Restoration
Hart-Miller Island, MD (Sec 1135)	1997	2006	2004	Environmental Restoration
Heritage Island, DC`	2005	2006	2006	Environmental Restoration
Howard A. Hanson Dam, WA (Sec 101(b)(15))	2002		2016	Environmental Mitigation, Restoration and Protection
Isle of Wight Bay, MD (Sec 206)	1999		2004	Aquatic Ecosystem Restoration
Kissimmee River, FL	1989		2019	Environmental Restoration
Ladd Marsh, OR	2002		2007	Environmental Restoration
Lake Seminole Habitat, FL	1998		1999	Environmental Restoration
Lake Nemaha Wetlands, KS (Sec 206)	2002		2003	Aquatic Ecosystem Restoration
Lebanon, NH (Phase III)	2002	2006	2007	Environmental Infrastructure
Little Falls Fish Passage #2 (Sec 1135)	1995	2000	2004	Aquatic Ecosystem Restoration
Lower Cape May Meadows-Cape May Point, NJ	2004		Undetermined	Environmental Restoration

APPENDIX B
Environmental Restoration Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Starte d	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Lower Columbia River Ecosystem Restoration, OR	2003		2011	Environmental Restoration
Lower Columbia River Slough, OR (Sec 1135)	2002		2008	Environmental Restoration
Lower Savannah River Basin, GA & SC	2002	2002	2002	Environmental Restoration
Lower Snake Fish & Wildlife Comp	1979		Undetermined	Environmental Restoration
Mississippi River, Mud Lake, IA	2004		2006	Environmental Restoration
Mississippi River, Pool II Islands, IA	2003		2005	Environmental Restoration
Millcreek-Milan Bottoms (Sec 1135)	1999		2003	Environmental Restoration
Missouri River Bank Stabilization & Navigation Project, NE	1992	1995	1995	Environmental Restoration
Missouri River Fish & Wildlife Recovery	1992		2042	Environmental Mitigation, Restoration & Protection
Modified Water deliveries to Everglades National Park	2005		2012	Environmental Restoration
Murphy's Slough, CA (Sec 1135)	1998		2007	Environmental Restoration
Nathan's Lake/Mud Lake Deer Creek, NE (Sec 206)	2000	2003	2003	Aquatic Ecosystem Restoration
Ninigret and Cross Mills Ponds, Charlestown, RI (Sec 206)	2005		2008	Aquatic Ecosystem Restoration
Northeast Pennsylvania, PA (Sec 219)	2003		Indefinite	Environmental Restoration
Northeastern Minnesota, MN	2001		Indefinite	Environmental Infrastructure
Northern Wisconsin, WI	2003		Indefinite	Environmental Infrastructure
North Fork Feather River, Chester, CA (Sec 1135)	1994	1995	2001	Environmental Restoration
Northside Prep/Von Steuben, Chicago River	2001		2004	Aquatic Ecosystem Restoration
Northwest Branch, Anacostia	2004		2005	Aquatic Ecosystem Restoration
Numana Dam, CA (Sec 1135)	1998		Unscheduled	Environmental Restoration
Ocean Pines, MD (Sec 206)	1999	2003	2003	Environmental Restoration
Ohio Environmental Restoration Program	2001		Indefinite	Environmental Restoration
Oquawka Refuge (Sec 1135)	1998		2003	Environmental Restoration
Pine Flat Bypass, CA (Sec 1135)	1998		2002	Environmental Restoration
Poplar Island, MD	1998		2014	Environmental Restoration

APPENDIX B
Environmental Restoration Projects Under Construction
During Fiscal Year 2007

Project	Fiscal Year Starte d	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Puget Sound and Adjacent Waters Program, WA	2003		2013	Environmental Mitigation, Restoration and Protection
Putah Creek, South Fork, CA	1999		2007	Environmental Restoration
Rathbun Lake Habitat Restoration, IA (Sec 1135)	2004		2007	Environmental Restoration
Rend City Wetlands Restoration, IL (Sec 1135)	2004		2007	Environmental Restoration
Rillito River Riparian & Wetland Development (Sec 1135)	2005		2008	Environmental Restoration

APPENDIX D
Navigation Projects Under Construction During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Agat Small Boat Harbor, Guam (Sec 107)	1987	1989	1989	Dredging and breakwater
Arthur Kill Channel, Howland Hook, Terminal, NY & NJ	2001			Deep draft channel-widening and deepening to 41ft.
Baltimore Harbor Anchorages and Channels, MD	2002	2003	2003	Deepen and Widen Anchorages
Baton Rouge, LA	1987	1987 ¹	Indefinite ²	Dredging 55-foot channel
Brunswick Harbor, GA	2002		Indefinite	Deepen to 36 feet.
Burns Harbor, IN	1995	1999	1999	Breakwater Rehabilitation
Calabash Creek, SC (Sec 107)	2000	2001	2001	Channel Deepening
Cape Cod Canal, MA	2000	2006	2006	Major Rehabilitation of Railroad Bridge
Chain of Rocks Canal, IL	1999	1953	Undetermined	Deficiency Correction
Channel to Newport News, VA (1965 Mod.)	1967	1968	Indefinite	Deferred anchorage construction
Channel to Newport News, VA (1986 Mod.)	1987	1989	Indefinite	Dredge 50 ft. Channel. Deepen to 55 feet
Channel to Victoria, TX	1993	2002	2008	Enlarging and deepening channel to 12 foot depth
Charleston Harbor (Deeping/Widening), SC	1998	2001	2008	Deepen Entrance Channel to 47 feet and inner channels to 45 feet depth.
Chicago Harbor (Lock), IL	1995	1997	1997	Lock Bulkhead Fabrication
Chicago Harbor (Lock), IL	1996	1997	1997	Construct Slots to Dewater Lock Gate Bays
Chickamauga Lock and Dam, TN	2004		2013	Construct 110-foot by 600-foot replacement lock.
Chignik Harbor, AK	2001		2004	Breakwater
Cleveland Harbor, OH	2007		2007 ⁵	Dredged approximately 183,687 cubic yards.
Coan River, VA	1993		2004	Channel Dredging /Jetty Construction
Columbia River Channel Improvements, OR & WA	2004		2010	Deepen channel and environmental restoration
Cook Inlet Navigation Improvement, AK	1998	2001	2001	Channel Dredging
Conneaut Harbor, OH	2006	2007	2007	Construction, Repair West Pier

APPENDIX D
Navigation Projects Under Construction During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Crescent City Harbor, CA	1998		2000	Deepen Channel
Delaware River Main Channel & Deepening, NJ, PA, & DE	1999		Undetermined	Deepen Channel
Emsworth Dam Rehab	2004		2011	Major Rehab of Back Channel Gates and Main Channel erosion protection
Grays Landing Lock & Dam (Lock & Dam 7) Monongahela River, PA	1986	1996	2005	Construct new lock & dam to replace existing lock & dam 7
Gulfport Harbor, MS	1991	1994	2006	Deepen Channel
Hempstead Harbor, NY	1992		1995	Removal of derelect barges
Houston-Galveston Navigation Channels, TX	1998		2010	Deepen and Widen Houston Ship Channel and Galveston Harbor and Channel; 45' depth in Houston Ship Channel completion-2005
Humboldt Harbor and Bay Deepening, CA	1997		2000	Deepening and Widen Channel
Illinois Waterway Four Locks	1993		1996	Major rehabilitation of locks and dams
Indiana Harbor Confined Disposal Facility, IN	2002		2040	Confined Disposal Facility (CDF) construction.
Inner Harbor Navigation Canal Lock	1999		Undetermined	Lock Replacement
J. Bennett Johnston Waterway, LA (formerly Red River Waterway)	1974	1984 ³	Indefinite ⁴	Channel improvement and realignment
Jacksonville Harbor, FL	1999		2009	Dredging material disposal facilities
John T. Myers Locks and Dam, IN & KY	2004		Indefinite	Lock Replacement
Kahului Light Draft Harbor, Maui, HI	2004	2007	2007	Breakwater and Navigation Channel
Kake Harbor, AK	1997	2001	2000	Breakwater and Navigation Channel
Kaumalapau Harbor, Lanai, HI	2004	2007	2007	Breakwater and Navigation Channel
Kawaihae Small Boat Harbor, Hawaii, HI	1996	1998	1998	Breakwater
Kentucky Lock Addition, KY	1998		2012	Lock Addition (1200 feet)
Kill Van Kull-Newark Bay, NJ and NY (Stage I)	1986		1995	Deep draft channel-widening and deepening to 40 ft.

APPENDIX D
Navigation Projects Under Construction During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Kill Van Kull-Newark Bay, NJ and NY (Stage II)	1999		2004	Deep draft channel-widening and deepening to 45 ft.
Laupahoehoe Harbor, Hawaii, HI	1988	1988	1988	Breakwater
Lock and Dams 2, 3 and 4, Monongahela, PA and WV	1992		2019	Major rehabilitation of locks and dams, removal of Lock and Dam 3
Lock and Dam 3, MN	1998		2013	Major rehabilitation/embankments
Lock and Dam 14, IL	1996	2001	2002	Major rehabilitation of lock and dam
Lock and Dam 24, MO	1996	1940	2008	Major rehabilitation of lock and dam
Lock and Dam 25, MO	1994	1939	2002	Major rehabilitation of lock and dam
Los Angeles Harbor, CA	1996		2010	Channel Deepening
McAlpine Lock and Dam	1996		2009	Lock Replacement (1200 feet)
McClellan-Kerr Arkansas River Navigation System, AR	1963	1970	2012	Locks and dams
Manatee Harbor, FL	1995		2010	Enlarge turning basin, construct wideners, mitigation
Marmet Locks & Dam, Kanawha River, WV	1998	2008	2009	Construction of new lock
Melvin Price Lock and Dam, IL and MO	1974	1990	2009	Replacement
Miami Harbor Channel, FL	1993		2012	Navigation Channels & Turning Basin
Mississippi River between Ohio and Missouri Rivers, IL and MO	1910		Undetermined	Regulating Works
Mississippi River, Locks 17, 21, & 22, IL and MO	2005		2006	New Lock Checkposts
Mississippi River, Lock II, IA	2005		2007	Lock Rehabilitation
Mississippi River, Lock 19, Stage II, IA	2004		2006	Lock Rehabilitation
Mississippi River, Ship Channel, Gulf to Mt. Morris Lake, NY	2002		2003 ⁵	Road Repair
Montgomery Point Lock and Dam, AR	1997	2005	2006	Lock and Dam
Morehead City Harbor, N.C. (CAP Sec 933)	2004	2004	2008 ⁶	Beneficial used of dredged material
Mouth of Colorado River, TX (Gulf Intracoastal Waterway)	1984	1994	1995	Breakwaters, dredging, and recreation

APPENDIX D
Navigation Projects Under Construction During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Nawiliwili Harbor, Kauai, HI	1985	1987	1987	Breakwater repair
Neches River Saltwater Barrier	2000		2005	Construction of a tainter-gated saltwater barrier structure, sector-gated navigation bypass channel, access road and levee
New York Harbor and Adjacent Channels, Port Jersey Channel, NJ	1998		2008	Deepening channel to 45 ft. providing a turning basin and bulkheading.
New York and New Jersey Harbors, NY and NJ	2002		Indefinite	Deep draft channel to 52 ft.
New York Harbor Collection and Removal of drift, NY & NJ	1976	Incremental	Indefinite	Removal of drift sources.
Nome Harbor, AK	2003	2007	2007	Breakwater, Navigation Channel, and sediment management scheme
Norfolk Harbor Channel, VA (1965 Mod.)	1966	Incremental	Indefinite	Removal of drift sources
Norfolk Harbor Channel, VA (1986 Mod.)	1987	1989	Indefinite	Dredge channel to 50 feet
Oakland Harbor, CA	1987		Indefinite	Channel deepening and widening turning basin
Olmsted Locks and Dam, IL & KY	1992		2015	Navigation
Oyster Point Harbor, CA (Sec 107)	2001		2008	Reconfigure wing-walls
Pascagoula Harbor, MS	1994		2004	Channel dredging and construction of a new turning basin
Point Marion, Lock & Dam 8, Monongahela River, PA	1986	1994	2002	Replaces existing 56x360' lock chamber with new 84'x720' chamber
Port of Florence, AL	1994	1995	1995	Channel Dredging
Port of Long Beach (Deepening), CA	1998		2010	Channel Deepening
Richmond Harbor, CA	1985		2000	Channel deepening and turning basin
Robert C. Byrd Locks and Dam, Ohio River	1985	1992	2010	Replacement of existing locks and major rehabilitation of the dam
Rockhold Creek, MD	2004		2006	New breakwater and modification of an existing breakwater

APPENDIX D
Navigation Projects Under Construction During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Rudee Inlet, VA	1990	1991	1991	Dredge 7 foot channel
Sacramento River Deep Water Ship Channel, CA	1986		Undetermined	Deep draft channel, widening and deepening
Salem River, NJ	1995	1996	1996	Channel deepening
Sand Point Harbor	2005	2007	2007	Breakwater Dredging
San Diego Harbor (Deepening), CA, Sec 107	2004		2005	Channel deepening
San Francisco Bay to Stockton, CA (John F. Baldwin and Stockton Ship Channels)	1971		Undetermined	Deep draft channel, widening, deepening and dredging
Santa Barbara Harbor, CA	1991		Indefinite	Acquire Dredge
Santa Monica Breakwater, CA	1998		Indefinite	Repair Breakwater
Savannah Harbor Deepening, GA	1993		1994	Channel deepening
Seward Harbor, AK	2004		2006	Expand harbor eastward
Shallow Creek Spur Channel, MD	1999	2000	2003	Spur Channel
Shinnecock Inlet, NY	1990		1995	Dredging and repair of Jetties
Sonoma Baylands Wetlands Demonstration Project, CA	1993		1997	Restoration of Tidal Wetlands on a 348 acre site
St. George Channel Extension, AK	1994		1996	Dredging
St. Lucie Inlet, FL	2001		2009	Impoundment basin and jetty elements
St. Paul Harbor Improvements, AK	1999		2005	Breakwater Improvements and Dredging
Taconite Harbor, MN	2000	2002	2002	Harbor of refuge construction
Taylor Point Cut, LA (107)	1999	1999	1999	Navigation cut from Charenton LK to Grand Isle
Tenn River, Port of Florence	1994		1995	Channel Improvements
Toledo Harbor, OH	2007		2007 ⁵	Dredged approximately 115,000 cubic yards from the Maumee River; dredged approximately 600,000 cubic yards from the Maumee Bay.
Westport River, MA (Sec 107)	2007		2008	Deepen Channel

APPENDIX D
Navigation Projects Under Construction During Fiscal Year 2007

Project	Fiscal Year Started	Placed in Useful Operation	Fiscal Year Completed or Scheduled for Completion	Nature of Project
Wilmington Harbor, NC	1999	2004	Unscheduled	Dredging to Deepen
Winfield Locks and Dam, Kanawha River, WV	1990	1997	2008	Construction of new lock
Wrangell Harbor, AK	2003		2005	Breakwater

APPENDIX D

Navigation Projects Under Construction During Fiscal Year 2007

¹ Walter B. Jones, Joseph P. Knapp, Core Creek, and Gene A. Potter Memorial Bridge and Fairfield Bridge are operational. Fairfield bridge is being closed out.

² Phase I, forty-five foot channel to New Orleans, LA. Forty-five foot channel to Mile 181 (Donaldsonville, LA) placed in useful operation in 1988. Phase II, forty-five foot channel from mile 181 to Baton Rouge placed in useful operation in 1994.

³ Awaiting further PCA's to go deeper than 45 feet.

⁴ Lock and Dam No. 1 placed in useful operation in 1984. Lock and Dam No. 2 in 1987. Lock and Dam No. 3 in 1992. Lock and Dam No. 4 and 5 in 1994.

⁵ Schedule for completion of entire project is indefinite. However, the project opened to 9-foot navigation on 31 December 1994.

⁶ O&M funded.

⁷ Placement of maintenance dredge material from the Morehead City Harbor, N.C. navigation project along Bogue Bank beaches of Salter Path, Indian Beach, and Pine Knoll Shores. CAP section 933 project.

APPENDIX E
Multiple-Purpose Projects Including Power
Operable September 30, 2007

NOMENCLATURE FOR PROJECT FUNCTIONS

D - Debris Control
F - Flood Control
I - Irrigation
N - Navigation

P - Power
R - Public Recreation Annual Attendance exceeding 5,000
S - Water Supply
W - Fish & Wildlife (Federal Or State)

¹ Total of all storage functions, including inactive and dead storage to normal full pool

² G: gravel; R: rock; C: concrete; E: earth

³ All six units have successfully generated power; however, repairs and modifications have been required on all units. Units 2, 3, 4, 5 and 6 fully repaired and operational. Repairs to remaining unit No. 1 will be completed in FY 99.

⁴ Being operated for the Department of Interior by the Bureau of Reclamation

⁵ Being operated by the Alaska Power Administration

⁶ Formerly Clarks Hill Lake

⁷ Units 5 and 6 were deauthorized in 1990.
